1.0 Problem Identification & User Research

In this part we'll be focusing on understanding the real problem that Frayt is Trying to Solve. In order to do it we needed to go beyond assumptions which we had till now and

actually ask people. We created a survey and shared it among different types of relevant stakeholders and collected 60 responses. Based on the information gathered we were able to confirm whether the problem is real, understand how people felt about the idea and gave us more ideas to figure out what they would want from a solution like Frayt to solve.

1.1 Identifying and validating a real user problem within selected sector

Before we sent the survey, we had a problem that we started with which is as follows :

"people in Jordan more often lose or ignore the small coin change that they get after paying using cash, while shop owners faces a problem with keeping the coins in their registers, and that's because there's no simple digital way to handle small change at the checkout, which costs consumers money, cause headaches for merchants and results in forcing the central bank of Jordan (CBJ) to keep on the production for the minting replacements of coins".

This was our starting point and conducting the survey research method was meant to either confirm it or help us make it more accurate.

1.2 research methods with relevant stakeholders

1.2.1 About the survey

We collected a total of 60 responses, where most of them came from everyday customers, which makes sense since they are the main users for Frayt. (all numbers can be verified form pictures in the **APPENDIX**)

Who responded	Number	Percentage
Everyday consumers	43	71.7%
Merchants / business owners	4	6.7%
Fintech / finance professionals	3	5.0%
Other	10	16.7%

1.2.2 What consumers told us (n=43)

- There age group

Most of the consumers responded that they were young with a percentage of 81.4% that they aged between 18-25, as for the remaining they were under the age of 18 with a percentage of 18.6%. the meaning of this that we are targeting the young which actually lines up perfectly with Frayt target audience since younger people are more likely to adopt a new digital tool quickly.

- How often do you make cash purchases

When it came to the question of how often they use cash the numbers were high, it reached a percentage of 51.2% that uses cash everyday and 44.2% do so several times a week. So nearly all of them are dealing with coin change on a very regular basis.

- The use of digital payments

We found that 84.9% already use some kind of digital payment app like CliQ or Zain Cash. Which is actually great for Frayt because these people are already comfortable with digital payments, so switching from physical coin into digital one shouldn't feel a big deal.

1.2.3 Is the coin problem actually real?

The answer for this question is actually "yes" because when asked how often they lose or forget their coin change, 69.8% said "often" or "almost every time". Which makes almost 7 out of every 10 people face this problem.

We also asked what they actually do with the coins they receive the most common answer was losing them in a bag, pocket, or car which had a percentage of 55.8%, which means half of them said they tried to use them, and around a quarter save them in a jar at home. People using jars actually shows us that some people do try to hold onto their change, they just don't have a better option than a physical container.

On monthly coin loss, the average came out to around **2.29 JOD per person per month** based on their own estimation. individually it doesn't sound a lot but across millions of daily cash users in Jordan it will adds up to be a very significant amount leaving **circulation every month.**

We also asked if they had ever been in a situation where the merchant couldn't give them the right change there was a percentage of 39.5% said yes with experiences showing not getting change at all or being told to take extra items from the shop instead.

1.2.4 How does it feel?

This was one of the most important questions, and we asked it as an open-ended question so we can feel our consumers frustration by saying it using their own words.

More than half the responses with a percentage of 55.8% were negative. People used words like "annoyed" "frustrated", "uncomfortable", and "like it's going to waste". One person said they felt "scammed". Which shows how pointless the coins could be to some people. Another person said "I didnt like what happend because i had some plans to do with 75 , not just taking more items from the shop in the same value".

About 18.6% had more of a positive experience with coins where they found coins actually useful for small purchases like transport or gum, or they save them up at home. And that's why we have a savings feature in Frayt, so these people are most likely to love this feature.

The remaining 25.6% weren't bothered enough to complain, but not happy with coins either.

We can see from the answers is that frustration is not really about money. People aren't upset that they lost 0.35 JOD or whatever it is They're frustrated because coins are heavy, noisy, hard to carry, and completely useless outside of physical cash transactions. Which shows the core problem that Frayt is trying to solve.

1.2.5 How do people feel about the idea of digital change?

The responses were very optimistic When we described the concept of receiving change into a digital wallet instead of getting coins, 86% scored it 4 or 5 out of 5. Which indicates a strong reaction to such an idea that doesn't even exist yet.

1.2.6 What features matter most?

When we asked consumers to rank possible Frayt features here's what came up :

Feature	Average score
Save toward a personal goal	2.6
Withdraw as cash	2.65
Spend the balance at any store	2.67
Donate to charity	2.67
Transfer to a friend or family	2.84

These numbers shows us how much people wants flexibility they want to be able to do different things with their balance depending on their situation. They don't want to be locked into one use case **(locked wallet).**

1.2.7 What might stop people from using Frayt?

Concern	Percentage
Not enough merchants would use it	48.8%
Nothing would stop me	41.9%
Too complicated	27.9%
Privacy concerns	20.9%
Don't trust new fintech apps	20.9%
I prefer cash	18.6%

As we see in table above, the biggest concern was that there's Not enough merchants would use it almost the half which makes complete sense because if you receive digital change but cannot spend it anywhere you normally go, it's useless. Which is the most important challenge Frayt needs to solve before anything else.

As for the second most common answer, with a percentage of 41.9% said **nothing would stop them.** That's nearly half of them ying they'd use it right away. Which is good for a product that doesn't exist yet.

1.2.8 Do they trust CBJ regulation?

65.1% said they would be more likely to use Frayt if it was regulated and approved by the Central Bank of Jordan. Moreover, nobody said regulation would make them less likely to use it, so getting CBJ approval isn't just a legal requirement, it is also one of the best marketing reputation Frayt can have.

1.2.9 How important is it that Frayt is free for consumers?

69.8% rated this 4 or 5 out of 5, Clear message: people expect this to be free, and charging them anything for receiving or spending their own change would be a concern for some of them.

So, would they actually try Frayt? 74.4% said they would score 4 or 5, with an average of 4.19 out of 5.

1.2.10 What Merchants Told Us (n=4)

All four merchant already accept digital payments, which means they are not starting from scratch digitally. However, the coins management takes in range of 1-6 hours per week where Frayt can directly eliminate this time to be less.

The most striking finding came from the **pharmacy.** They run out of coins almost every day, but their adoption intent was only 2 out of 5, and they wouldn't pay a monthly fee. Their reason was as follows: " Customers wouldn't use it". Which is a clear example in the entire survey of why Faryat adoption challenge is crucial because the merchants who need it most won't adopt it unless consumers already do, and consumers won't use it unless merchants do.

On the other hand, the supermarket they rated the concept 5/5 as positive for their business, 5/5 that would willingly use a QR system, and said CBJ regulation would make them trust it "much more". And that's exactly the type of merchant we are going to target first.

Merchants ranked features that they care about the most, that will result in eliminating coin shortages. Moreover, merchants see Frayt as a customer attraction tool, not just a coin management fix.

As for the monthly fees three out of four merchants were willing to pay between 1–7 JOD per month, even if it is a small sample of merchants but validates the subscription revenue model.

1.2.11 What Finance/Fintech Experts Told Us (n=3)

The most eyecatcher response was from a banker with over 10 years in the field where he rated the problem significance at 5/5 and Frayt adoption likelihood at 5/5. However, they chose "none I don't think the model is sustainable" for the revenue model question and indicated that the CBJ policy compliance as the key barrier.

1.3 initial and refined problem statement based on stake holders feedback

Before the conduction of the survey, we made assumptions and a problem statement, let's refine them based on values got form our research as the following :

"Young people in Jordan that uses cash regularly are in the age group of 18 to 25 where they keep ending up having coin change that they cannot do anything useful with it. It's not that they don't care about the money, it's that coins are inconvenient, and noisy. Nearly 7 in 10 consumers have been in situations where the merchant wasn't able to even give them the right change. Merchants on the other hand spend hours per week dealing with coins and watching customers get frustrated. And the ones with the worst coin problems like the pharmacist won't switch to a digital system because they don't think their customers will go along with it. The solution doesn't exist yet: there's no simple, trusted way to turn small cash change into digital money at the moment of the transaction. 86% of the consumers we surveyed responded positively to the idea, and 74% said they'd try Frayt today as long as it's accepted at enough of the stores they already shop in".

So based on that let's list some of the assumptions we had in the our initial problem statement and the current problem statement to see if we were close enough to immersing users problems or not.

1- Coin loss is frequent : 69.8% lose coins often or almost every time. Most people described it negatively in their own words.

2- The frustration is mainly about losing money: in here we are partially wrong because People aren't really upset about the financial value, they are frustrated because of inconvenience and how useless coins sometimes can be of coins. So, we learned from this assumption that Frayt should talk about usability, not money recovery.

3- People would be open to a digital alternative, as we mentioned 86% responded positively to the concept. Zero people said they would definitely not try it.

4- Trust and CBJ regulation would be key to adoption, this assumption was also correct but there's an order that should be taken in consideration that the merchant coverage comes first, CBJ trust comes second. Which means we have to build first to make the idea effective, because if users opened the app and couldn't actually use it anywhere, they would not adopt it.

2.0 Target Market & User Persona

Target Market

the target audience for our solution it includes both cash paying consumers and cashier merchants in Jordan, who are involved in a direct way with the daily cash transactions.

So, the primary target group is cash paying consumers, specifically young adults that they are aged 18-35 in Jordan who are frequently making purchases in supermarkets and small retail stores, and this group is more open to use new technologies and solutions that are digital that can make daily transactions simpler.

Moreover, these users often receive small coin change during purchases, and this creates repeated inconvenience, because coins are commonly ignored, lost, or difficult to be carried, and this leads to a clear repeated behavior pattern, and daily frustration. Because they are familiar with mobile applications and digital tools, they are more likely to adopt solutions that will help them to manage or replace small coins in a more convenient way.

The secondary target group is the cashier merchants, which includes employees working in supermarkets and small retail stores. These users are responsible for managing the cash transactions and it requires to provide the exact amount of change. Moreover, they also face a lot of challenges during daily cash transactions like coin shortages, slower transactions, and dealing with customers who refuse small coins.

So, when we target both groups, the solution will ensure that there is going to be better adoption and usability, as it shows the needs, behavior, and challenges of all stakeholders that are involved in the cash exchange process.

User Persona:

cash paying consumer Persona

Persona 1 (fictional): a 20-year-old university student in Amman with a busy schedule between lectures, assignments, and social life. He often buys food, drinks, and small items from nearby supermarkets, usually paying with cash because it is faster and more common for small purchases. Goals: complete purchases quickly without delays and avoid inconvenience during daily transactions. Motivations: save time between lectures, reduce small daily frustrations, and feel more in control of his money. Challenges: a tight schedule, frequent small transactions, no practical way to use coins, and a feeling that managing small coins is not worth the effort.

cashier merchants

Persona 2 (fictional): a 30-year-old cashier at a busy local supermarket in Amman. He works long shifts and serves many customers every day, especially during evenings and weekends, so his job requires speed, accuracy, and constant interaction with customers. Goals: serve customers quickly without delays and keep cash handling accurate and organized. Motivations: avoid the stress of long queues, keep customers satisfied, and work efficiently and professionally. Challenges: high customer flow during peak hours, limited availability of coins, pressure to be both fast and accurate, and different customer attitudes toward coins.

3.0 Solution & Value Proposition

3.1 Business Solution

While we were doing research, and after understanding different problems for merchants, CBJ, and consumers, we asked ourselves two main questions, how might we help cash paying consumers to turn small amounts of coin change into a usable value at the points of purchases without having to carry inconvenient and annoying coins in their pockets, or losing them, or even ignoring them? And how might we help merchants to speed up the payment process for their consumers while still giving the consumers their coin change even when physical coins are not available?

These questions guided us to develop Frayt, a digital wallet platform built specifically for Jordan's cash economy. Frayt converts physical coin change into usable digital value. Frayt works in a way that speeds up the payment process, as when a customer pays cash and is owed coin change, the merchant either displays a QR code where customer scans it or the merchant enters the customer's registered mobile number into Frayt. The customer confirms the transaction through the application or through an OTP, and the exact change amount (0.05, 0.20, 0.48, etc) is credited to the customer's Frayt digital wallet. The customer receives the full value of their change without dealing with any physical coin change, and the merchant can return the exact change to the consumers when coins are not available.

The users of Frayt can spend these coin credits across multiple Frayt merchants and transactions, as they can save it within Frayt in the saving jar for a personal goal, pay their bills including electricity, water, education, or government bills, transfer it to another Frayt user, withdraw it, donate it to a verified charity, or even turn use the points system that are spent at any Frayt merchant.

Frayt does not try to replace all forms of payment. Instead, it focuses on solving specific gaps in everyday cash transactions such as what happens to the small amount of coin that consumers do not want to carry physically but also not want to lose it, how to make the full value of these coins usable , and how to speed up the payment process while ensuring that consumers still receive their full amount of change.

3.2 How it addresses the identified problem

Frayt addresses the problem on three levels including the user level, the merchant level, and the economic level.

For the user level, the problem is that physical coins are often inconvenient and annoying to carry, coins are easy to lose, and the discomfort of leaving coins behind or not caring about small amounts of money. Frayt addresses this by converting coin change into digital balance instead of letting the coins disappear physically or be wasted. As a

result, Frayt fulfils the user's need, as they can complete a payment process, receive correct change, and keep the full value in their money in a usable form. For example, a customer purchase something with 1.05, and does not want to get out of the shop with hands full of coins is no longer has to get out of the shop with hands full of physical coins.

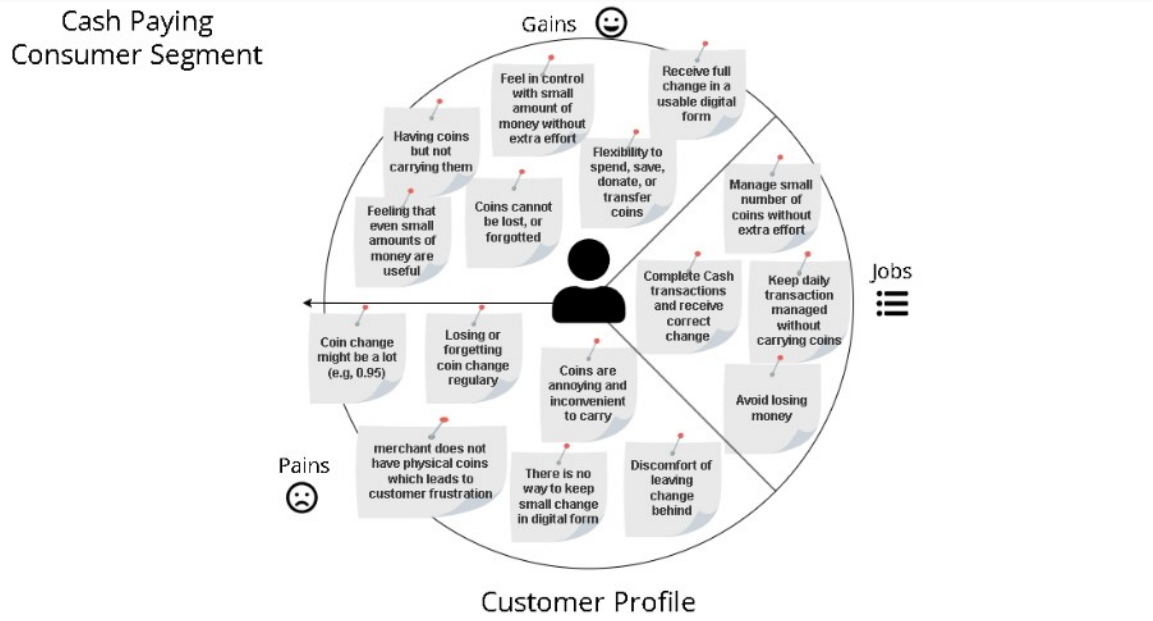

For the merchant level, the problem is that sometimes they run out of coins, which slow the checkout process while they search for coins or force merchants to tell the customer that the change is not available. Frayt addreses this by giving the merchant a digital alternative for returning change, which can speed up the payment process and reduce the need of a physical coin. For example, a supermarket that run out of 0.25 and 0.05 coins daily no longer has to round up or ask the customer to accept something different.

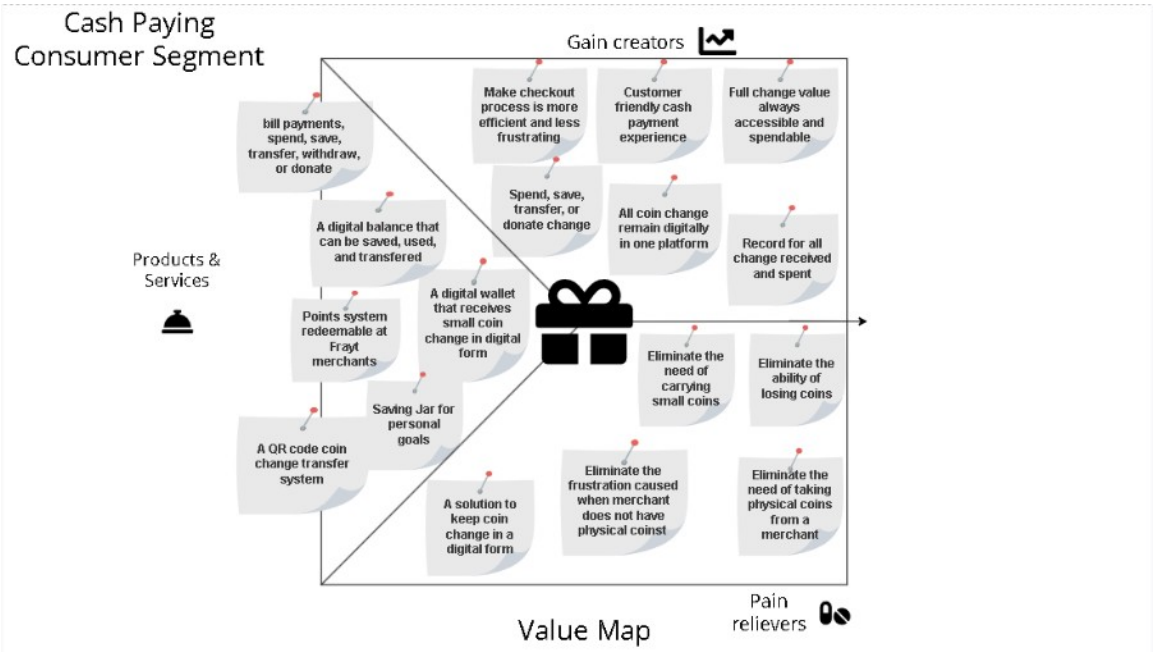

For the economic level, the problem is that the Central Bank of Jordan (CBJ) have the responsibility for ongoing costs for maintaining replacement coins because existing coins are lost and exit the active circular. Frayt addresses this by reducing the reliance on physical coin handling, and because the coins are digitalized, these coins do not exit the active circular. As a result, the CBJ's need produce more replacement coins is reduced.

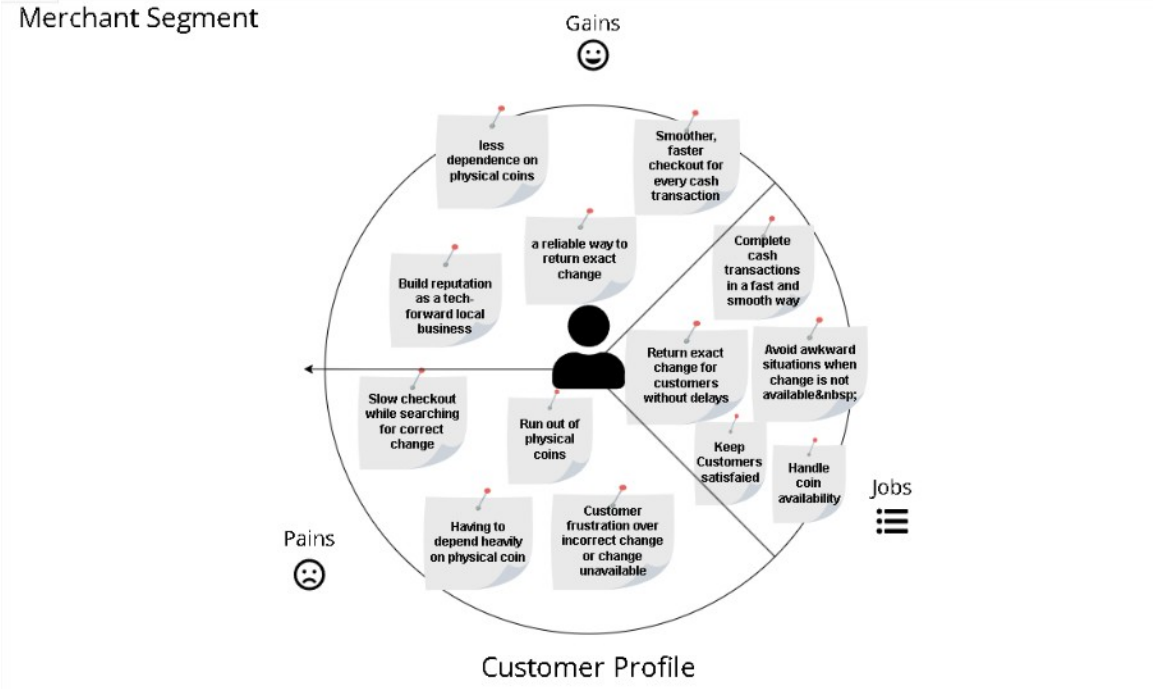

The solution does not force people to change what they want, it gives them what they already want but did not get it before, as the research showed that 41.9% of consumers said that nothing would stop them from using Frayt, and 86% said that they would feel positive about receiving digital change.

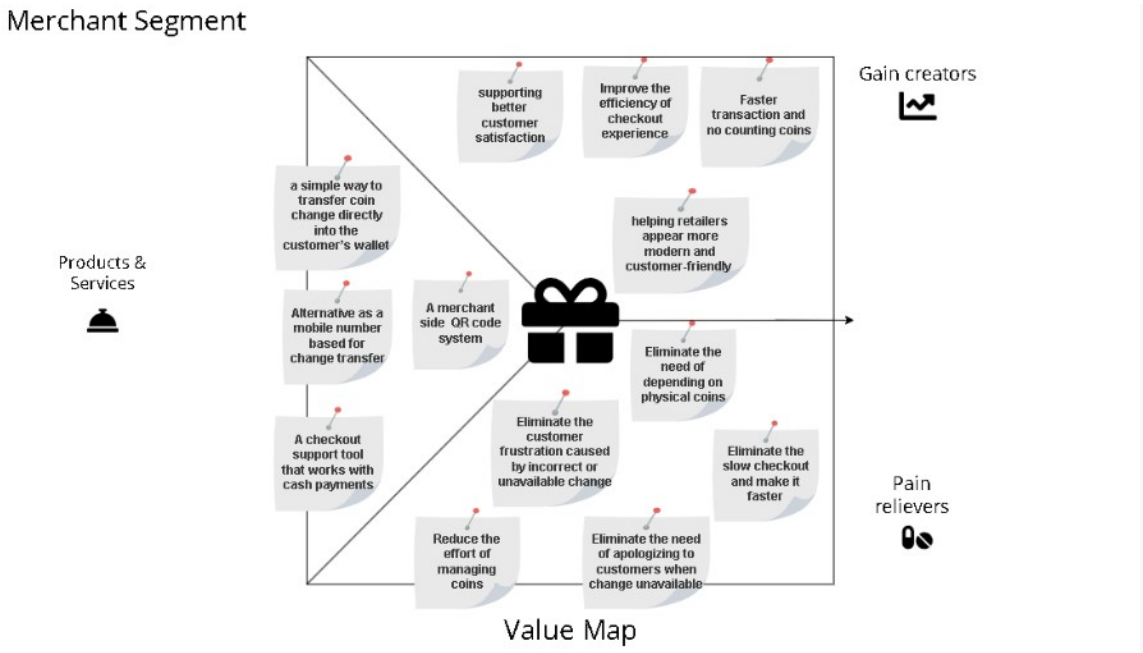

3.3 Value Proposition

3.3.1 Value Proposition Canvas

3.3.2 Consumer Statement

Frayt helps cash paying consumers who want to recive the full value of their coin change without losing, ignoring, and leaving it, and without carrying inconvenient physical coin by converting their inconvenient physical coin change into a convenient digital form that

eliminate coin loss and enabling a spendable, saveable digital balance, unlike the traditional cash change that is inconvenient to carry and easy to lose, ignore, or leave behind.

3.3.3 Merchant Statement

Frayt helps merchants who want to return exact change to customers in a fast way without depending on physical coin availability and want to speed up the coin change returns process by converting the coin change returns to a digital form that eliminates the daily operational costs of managing, and running out of coins, and enabling a faster checkout process that raises the customer satisfaction, unlike the traditional checkout process that depend heavily on the availability of physical coins.

3.4 Why should users use Frayt?

3.4.1 For Consumers

The strongest reason why a consumer should use Frayt because it gives back money they are already losing. Every cash purchase that results in coin change leads to a predictable coin fate, as it ends up forgotten on the counter, lost in a bag or car, or stored in a physical jar that stays unused. The research we made found that 69.8% of consumers often lose or forget their coin change, and it's not about they don’t care, it's about the result of coins being inconvenient to carry and useless for digital transactions.

There is no hard and complex setup for the consumer, everything required is a mobile number, national id, and sixty seconds to set up a wallet, and from that point, every coin change they are owed is credited directly to their Frayt wallet at the moment the transaction happens and without any single coin loss.

After receiving the digital value, the balance is flexible and can be used, as consumers can use their balance in multiple ways such as:

- save it within Frayt in the saving jar for a personal goal.
- Pay their bills including electricity, water, education, or government bills.
- Transfer it.
- Withdraw it.
- Donate it to a verified charity.
- Points system that are spent at any Frayt merchant.

Frayt improve the cash payment experience by reducing the inconvenience with physical coin change, and customers are no longer having to leave a shop with their hands or pockets full of coins.

We offer a new way of completing transactions that results in coin change in a one single user-friendly platform that is easy to use and easy to set up.

3.4.2 For Merchants

The strongest reason why a merchant should use Frayt because it solves a regurarly happening operational issue that does not have a solution which is running out of coin change. The research found that a pharmacy owner runs out of coins almost every day, and when it happens the merchant have three options that are not efficient such as:

1. Round the change up and take the responsibility of the cost themselves.
2. Ask the consumer to accept a different amount.
3. Slow down the checkout queue while searching for the right category of coins.

Frayt give the merchant a fourth efficient option, as merchant can return exact change in seconds.

Fray does not replace the transactions completly, it only gives the merchant a practical digital application that fit inside the existing cash transaction which is perfect for businesses that often handle cash transactions but want an efficient way to deal with coin change.

Frayt improve customer satisfaction, as when customer get their full exact change quickly and in a convenient way, the customer satisfaction is improved, and the payment process feels less frustrating.

Frayt is easy to setup for the merchant, it does not require hardware purchases or any complex setup, and it just can be installed within the existing POS system or download the application and sign up as a merchant while Frayt team can verify the identity of that merchant.

4.0 Prototype & Testing Plan

Protype link : [https://frayt.netlify.app/]

(OTP :1234)

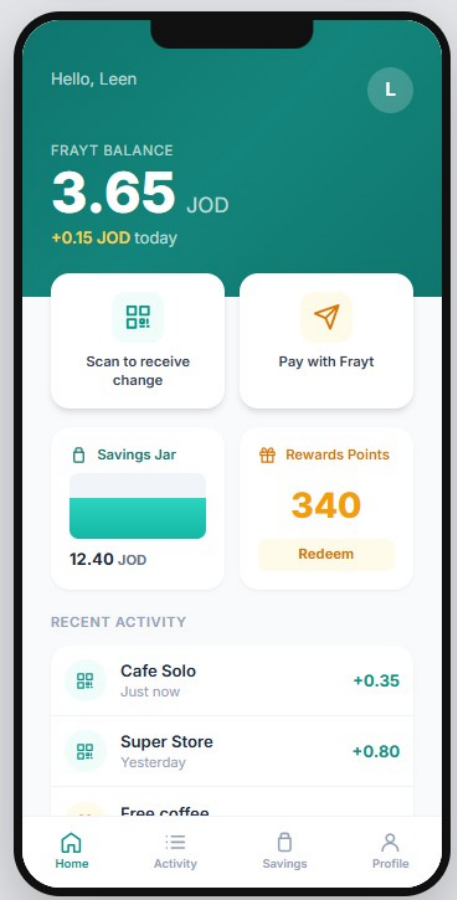

4.1 Presenting our initial prototype and key features

4.1.1 Customer Side

Our prototype is a mobile web app that covers both side of the transaction the customer wallet along with multiple features and the merchant cashier screen. This is a first iteration protype that was done to see complete experience for both the consumer and the merchant, which will of course have an upgrade in the next iterations.

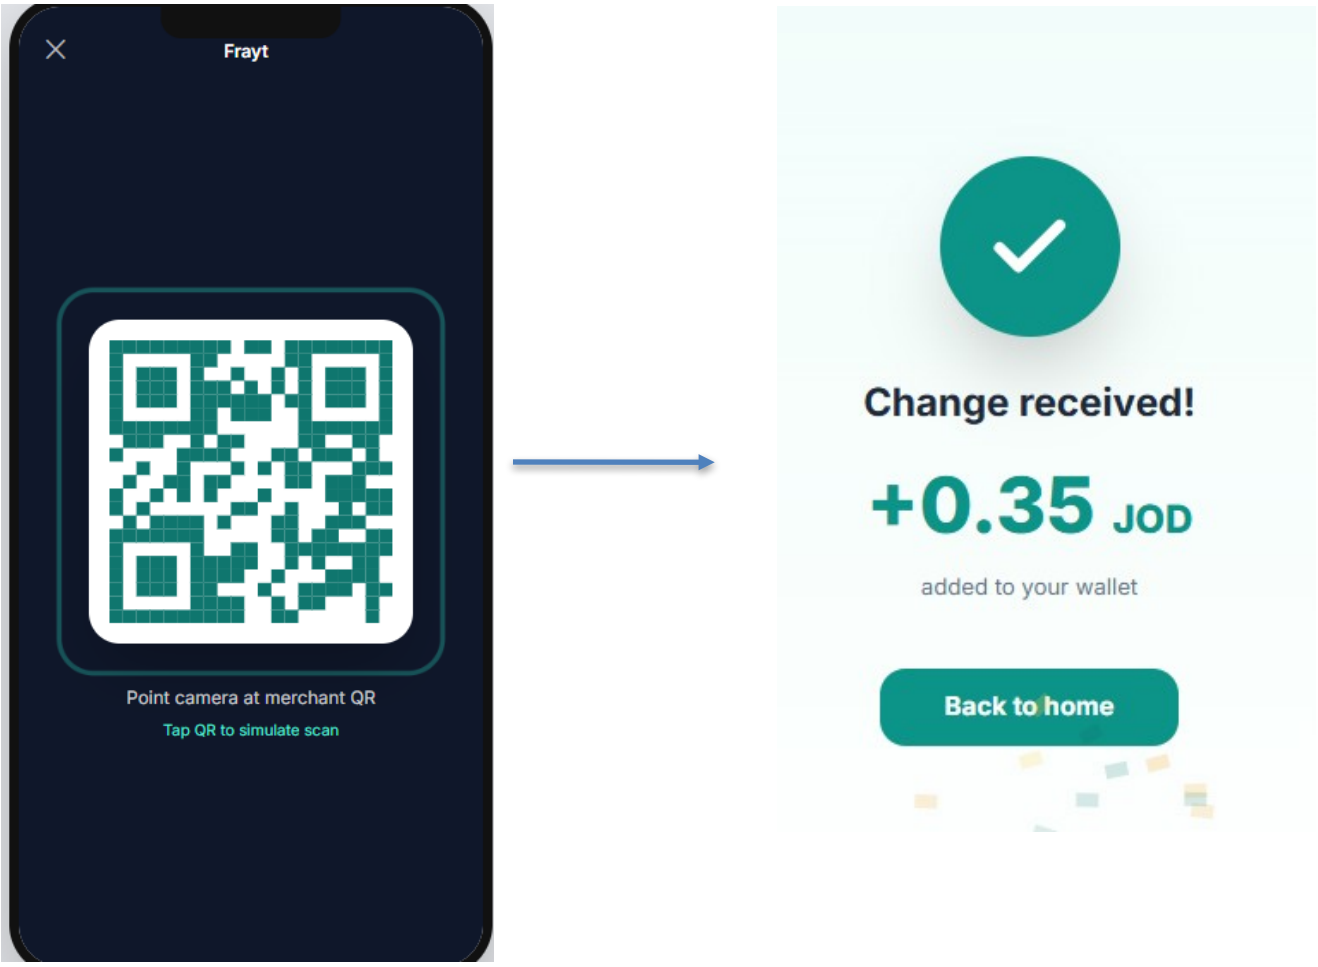

- **Home screen**

The home screen for the customer is described as a wallet where we can see the balance we have from coins. Moreover, we can see what features we can work with inside the wallet using either our balance or reward points, along with a list of recent transactions.

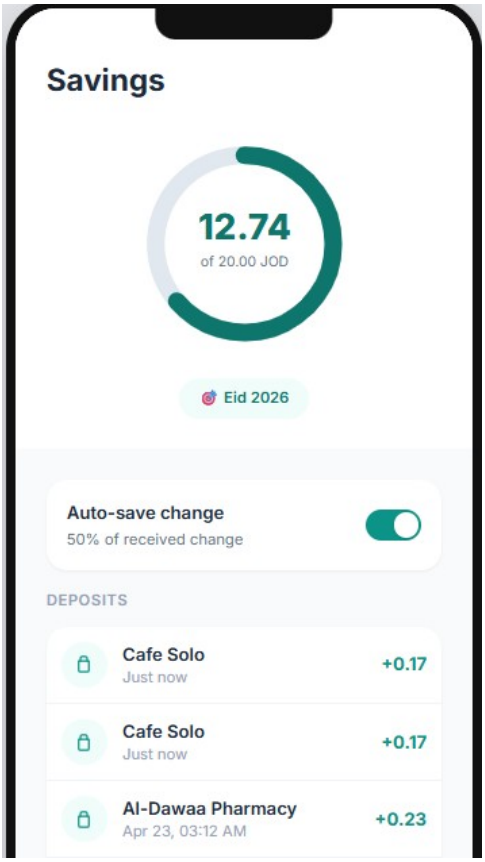

- **Scan to collect change**

There's a feature in the home screen which we represented earlier that looks like a QR code, for this feature the user clicks on the QR symbol and taps Scan and points their camera at the merchant's QR code. The change amount is transferred to their wallet as soon as the payment is successfully done. Once it is successful the customer screen shows a confirmation message with a small animation. This replaces the moment that used to end with "keep the change "and now ends with the user watching their balance go up.

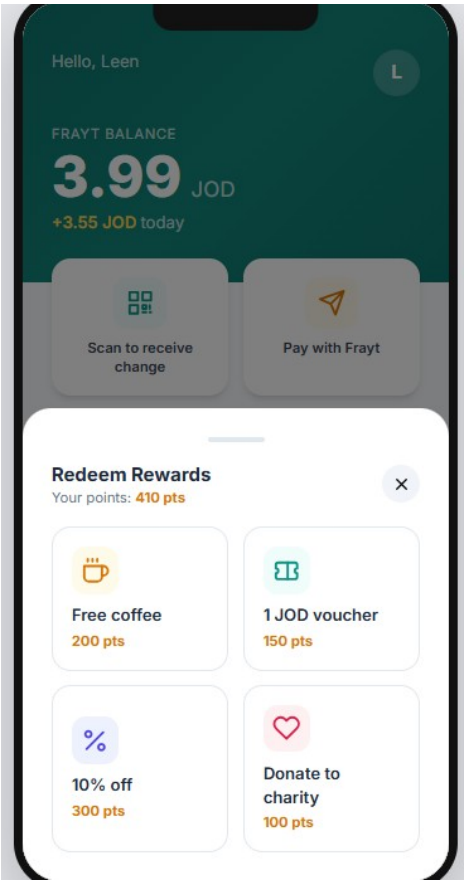

- **Savings jar**

Every time the user scans a QR and collects change some of the change will automatically turn into a separate savings jar. The user doesn't have to think about it, this is considered a behavioral design choice for people, because there will be savings without the customer noticing, which is exactly what the survey showed many users already try to do manually with a coin jar at home. Frayt just does it for them.

- **Reward points**

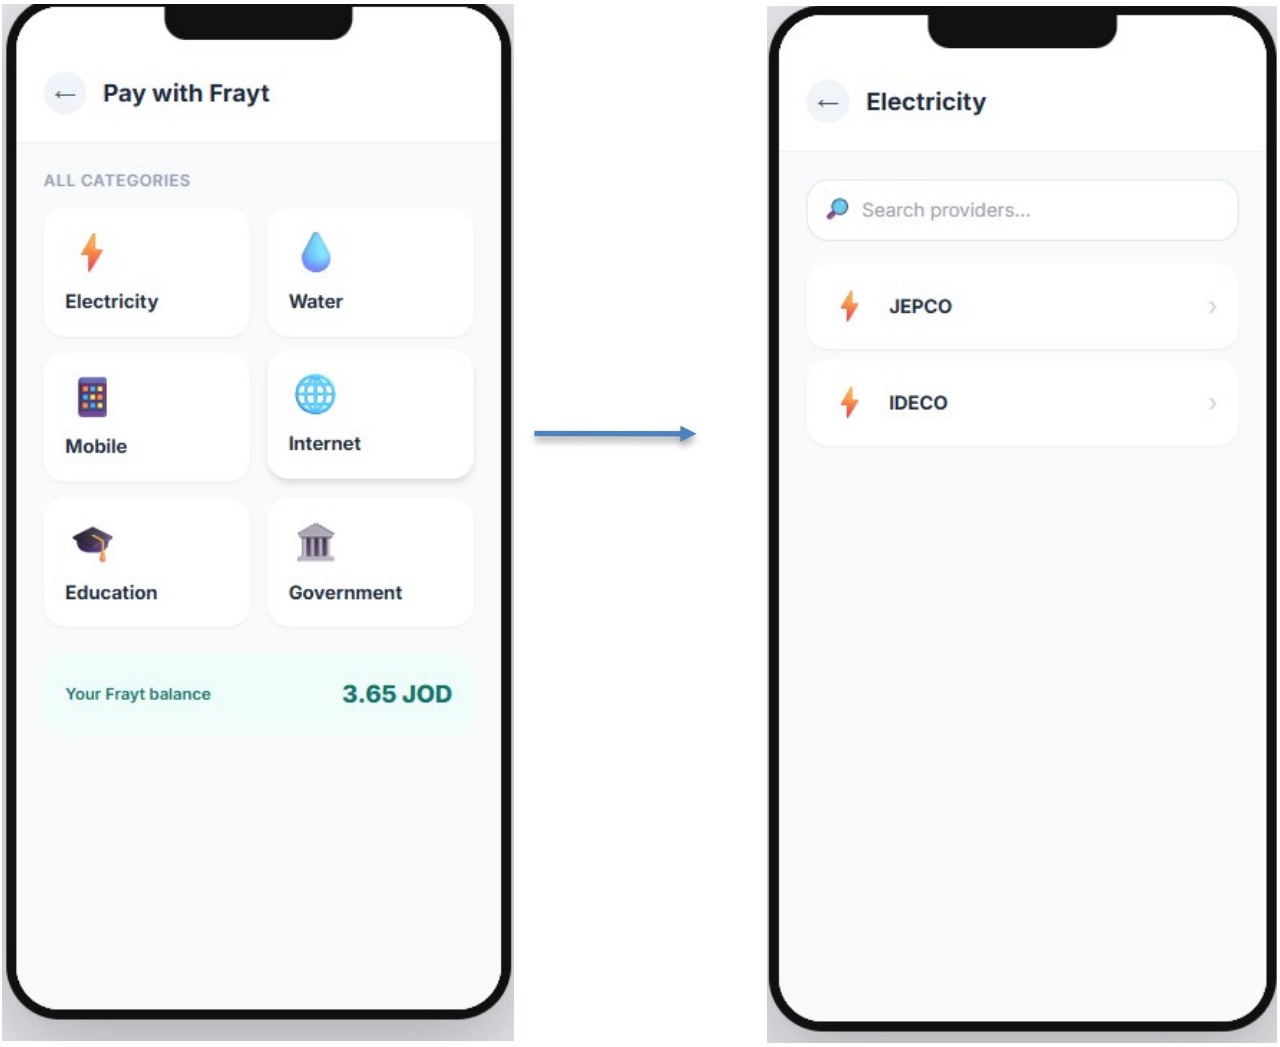

Every successful transaction the user will earn points (as an example 1 point per change). This turns the JOD transaction into something that feels like a small win. It also gives users a second reason to scan consistently, separate from the financial one. Moreover, these Points can be exchanged for free coffee, vouchers, discounts, or charitable donations.

- **Pay with Frayt**

In this feature the user will be able to pay utility bills, mobile top ups, internet bills, university fees and government fees directly from their Frayt balance. There are 12 billers available in the prototype covering JEPCO, IDECO, Miyahuna, Yarmouk Water, Zain, Orange, Umniah and much more. Users can also save frequently used billers with a nickname, so they don't have to reenter same details every month.

This feature matters the most because paying bills in Jordan can be done by entering the amount of money you like, so people will pay half of their bills using the change they received from different transactions without noticing.

- **Bilingual interface (Arabic and English)**

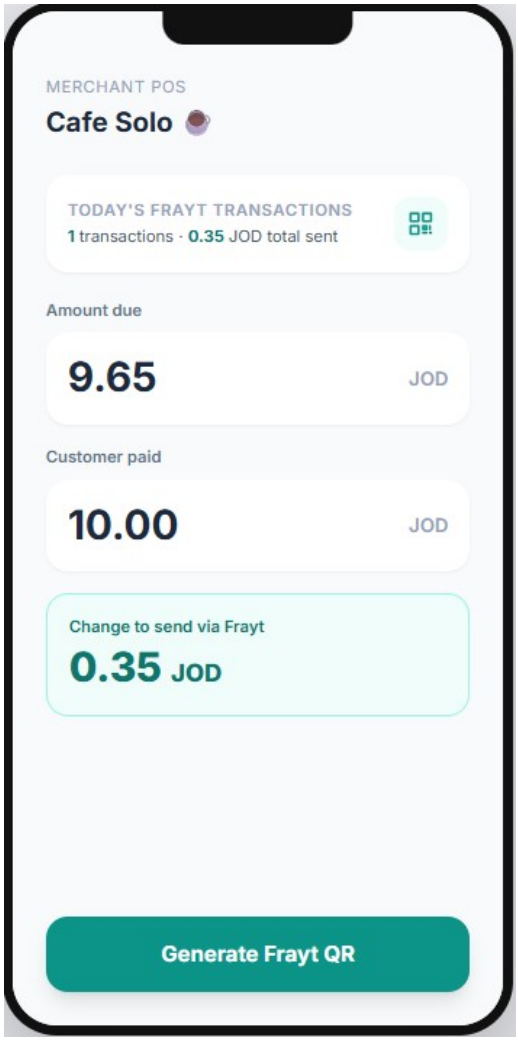

Labels and biller names appear in both languages which is considered not optional for a product targeting mass adoption in Jordan which is an Arab country it's a requirement.

4.1.2 Merchant Side

The cashier enters the transaction total and the amount that the customer paid. The app calculates the change and displays scannable QR code on screen. Any phone, tablet, or browser would be fine for the user to receive his change using Frayt . The QR is unique to that transaction and can only be scanned once, which will prevent any missuse.

Moreover, the merchant screen shows how many QR codes have been scanned today and the total amount of change. Which will give the cashiers and shop owners visibility into whether Frayt is actually being used during the day, without needing to check any separate dashboard.

4.2 a testing plan (target users, feedback methods, success metrics)

in this test plan our scope will be to answer different kind of question that will us how our success dealt with the prototype. Therefore, we will not be proving that Frayt will succeed but it's to answer four specific questions before going deeper:

1. Will the user be able to complete a scan and credit the transaction to Frat on their own without any explanation?
2. The feature saving jar feels helpful, or does it feel like the app is taking money away from them?
3. Does the wallet feel like real money of value or just feels like an arcade game?

This question will be answered based on two segments which are as follows :

Segment A-daily cash users where they belong to the age group of 18-35

As an example, university students who use Amman use cash regularly at cafes and small shops where we'll be reaching out through university WhatsApp groups. And we might give a reward for participating.

Segment B- Pilot merchant

We'll be testing one cafe and one service shop like a pharmacy or barber shops which we can do all in the same area, so we know if customers who encounter Frayt at one place ask about it at another. We'll be reaching out with places that we already have a have a relationship with.

- **How the test is done**

We are going to start with a quick walk through with **segment A** with a range of 5–10-minute casual session, not a formal test. Where we'll give our participant the phone with the app open and ask them to try collecting change using QR code. We're not timing them or grading them we just watch where they get confused and ask them some question after they are done.

For **segment B** rather than standing over and watching what the cashier is doing which would make many uncomfortable, instead we'll be checking in with the shop owner or manager at the end of each day for the first week with a quick 5-minute conversation asking them questions like "did they use Frayt today?", "Did customers ask about it?" and "Was anything confusing?". We can see actual numbers from the backend logs, how many QRs were generated and how many were scanned.

- **Success Metrices**

1. **Adoption**

What we measure	Target	What it tells us
Sign-up à first scan	At least 60%	If lower, it means that the interface isn't clear enough
First scan à second scan within 7 days	At least 35%	If lower people tried it once and moved on
First scan à bill payment within 14 days	At least 20%	If lower people doesn't have the feeling that the balance is actually becoming useful
First scan à visiting a second merchant	At least 25%	If it is lower, then the users don’t see it as something usable beyond one shop.

2. **Engagement**

What we measure	Target	What it tells us
Average scans per active user per week	At least 2	One scan per weekday is a realistic habit
Merchant QR codes generated per day	At least 5	Below this, the cashier has quietly stopped offering it
Customer acceptance rate when offered	At least 30%	It is something usual for an unproven concept
Reward and savings feature interaction rate	At least 40 %	If lower this indicates that the feature sir ither unclear on isn't useful as we thought.

3. **Trust and qualitative**

What we measure	Target
"Feels like real money" score	Average 3.5 out of 5 or higher
Would recommend to a friend	At least 50% say yes or maybe
Merchants who want to continue	At least 2 out of 3
Ethical and halal invest	90% should believe that we are compiling based on halal values

- **Risks and how we are going to handle them**

Risk	What should be done
People don’t trust what the app does	We can add one line inside the app that explains everything or we can have a frequently asked question along with answers in the app
QR scanning feels unsafe	We'll make sure that the QR is a unique one that doesn’t work from different phones to keep consumers balances safe
Casher can forget ow to explain the Frayt idea	We can give them simple sentence to repeat every time or most of the time
Customers in a hurry and says no	We should make the flow very fast with no long steps and we should accept that some people will skip and we should focus on repeat users.
Internet connection is weak in shops	We can test the pilot merchants before starting.
Users try it once and forget about it	We can send them an inserted message that they become curious and take a look

5.0 Testing Execution & Refinement

5.1 How Testing Was Conducted

5.1.1 Scope and goals

Back in section 4.2 we defined three questions where we wanted the testing to answer these questions for us, we kept asking these exact questions as the scope of execution without expanding the scope mid testing.

- Can a first-time user complete a scan-to-collect transaction on their own, without anyone explaining the app to them?
- Does the savings jar feature feel helpful, or does it feel like the app is silently taking money from the user?
- Does the digital balance feel like real money, or does it feel like points in a game?

As for the merchants side we added one important question which is the following:

- Can a cashier generate a Frayt QR code in less time than it takes to physically count and hand out coin change?

Moving and testing to answer these question guided our testing process.

5.1.2 Participants

Back in the previous section we planned for Segment A (daily cash users, ages 18–35, reached through university WhatsApp groups) and Segment B (pilot merchants reached through personal contacts). We kept exactly the same structure. And a total of 6 participants joined the testing week.

Participant	Role	Age	Context
C1	University student	20	Frequent cash user, uses CliQ
C2	University student	20	Mixed cash and digital, uses Zain Cash
C3	University student	22	Mostly cash, no fintech app installed
C4	Fresh graduate	24	Heavy digital user, uses Apple Pay
M1	Small café owner	--	Amman, one branch, around 80 cash transactions per day
M2	Neighborhood grocery cashier	--	Family shop runs out of coins around 3 times per week

From C1 to C4 they were chosen from the university WhatsApp group. As for the M1 and M2 were chosen through existing personal contacts of the team, both agreed to spend 20–30 minutes with us during a quiet hour in their shop, which is exactly the non-intrusive approach described in Section 4.2.

5.1.3 Method

Consumer side (C1–C4): we used a think loud approach. Each participant was handed a phone with the Frayt prototype already open on the home screen, given a short scenario "you just paid for a coffee with a 10 JOD note and the cashier owes you 0.35 JOD change, try collecting them" and asked them to tell us what they are doing and thinking as they went as they were moving in with the process. We observed silently and only stepped in when the participant was completely stuck the session was about 1- 2 minutes followed by a 5-minute post-task conversation. Which matched what were done back in section 4.2.

Merchant side (M1, M2): Rather than standing over the cashier during a live shift which would make everyone uncomfortable and produce unrealistic behavior we sat with each merchant outside of peak hours and walked them through the merchant interface. We then asked them to work through three different customer scenarios: a customer who has Frayt and scans, a customer who has Frayt but is in a hurry, and a customer who does not have Frayt at all. At the end of each day during the test period, we checked in with a quick 5-minute conversation asking whether they used it, whether customers responded, and whether anything was confusing.

5.2 Key Feedback from Users and stakeholders

The feedback was designed to be in three different sections :

5.2.1 Consumer feedback

On the scan-to-collect flow:

Three out of four consumers completed the first scan on their own without any help, C1, C3, and C4. C2 pointed her camera at a QR code on a juice bottle sitting on the table next to her, thinking the app was a general QR scanner. This was a useful confusion: the home screen QR icon was not visually distinct enough from a generic QR utility. C1 said the moment of seeing the balance update after the scan was "satisfying, described it like the change went somewhere instead of just disappearing". C4 where it was the most digitally experienced participant, said the flow felt slightly slower than CliQ scan-to-pay and asked why the QR was not pre-generated ?.

On the savings jar:

C3 saw 0.02 JOD move to the savings jar after a 0.45 JOD scan and asked "wait, where did 0.02 go? Is the app taking that ?" exactly the risk identified in our testing plan. After explaining it was their savings, both C2 and C3 said they were comfortable with the concept but wanted to see the split announced clearly at the moment of the transaction, not discovered later by opening the jar. C1 and C4 liked the feature immediately. C4 said it reminded her of how a local bank's round-up savings feature used to work.

On bill payment with small balances:

This process clearly saw that it produced the strongest positive reaction of the entire consumer testing. All three participants who tested it, C1, C3 and C4 said the same thing in different words: "I can actually use this to pay off part of my electricity bill?" C4 was initially skeptical that JEPCO (Jordanian electricity company in Jordan) would accept a partial payment that small and asked whether balances would actually be taken out of Frayt. This feature may be a stronger adoption hook than the coin collection itself, and honestly, there's a problem which is that this feature was buried too deep in the current prototype for most users to find naturally.

TRUST :

Three out of four consumers asked "is this regulated? Is it safe to put money in here?" C2 specifically asked where she could see a CBJ approval mark. trust is not a feature that Frayt offers, it is a barrier that Frayt must actively dismantle. Our prototype showed no visible trust signals on the home screen at all.

5.2.2 Merchant feedback

Both M1 and M2 found the merchant side straightforward. M1 generated her first QR in under 15 seconds without any instruction. M2 took around 30 seconds on her first attempt

and under 10 seconds by the third. The speed question from our testing plan was answered clearly : "yes, generating a Frayt QR is faster than counting coin change".

when the customer does not have Frayt :

This is where the prototype had a complete gap, there was no flow for what the cashier does when a customer refuses or does not have the app. Both merchants got stuck. M1 said: "I don't want to be the one explaining Frayt to every customer who comes in. After the third time I'll stop offering it." This is one of the most important findings and that's because we fund out that Merchant adoption does not only depend on signing the merchant up, but it also depends on making it easy to offer and easy to skip, so the cashier never feels burdened.

On fees:

M1 said he would pay between 5 and 10 JOD per month if Frayt brought in noticeable foot traffic from being listed in the customer app. M2 said he only pay if the system saved her at least one hour of coin handling per week. Both preferred a free trail with an optional paid upgrade over a flat monthly subscription (this is like freemium).

5.3 Refinements Made to the Prototype

All of the refinements will can be verified in [appendix B]

5.3.1 Consumer-side refinements

Feedback that made us make a refinement	Refinement made
Consumer number 2 (C2) pointed the camera at a juice-bottle QR, thinking Frayt was a generic QR scanner.	Made the scan entry point a written with a labelled action that says " Scan to receive change" instead of a bare QR icon, so it cannot be mistaken for a general-purpose scanner.
Consumer 3 (C3) saw change with an amount of 0.02 JOD move to the jar and asked "where did 0.02 go? Is the app taking that?" which means both C2 and C3 wanted the split shown at the moment of the transaction, not discovered later.	Now when it is a successful scan between the merchant and the customer the screen shows how the change were split by adding : " spendable Balance, Savings Jar, and reward points " instead of only showing the total and we removed the auto dismiss so the user can take his time reading it and then dismiss it manually
Three out of four consumers as we mentioned asked " is this regulated? Is it safe to put money here?" , and C2 looked for a CBJ approval mark. The prototype showed no signals at all.	So, we added tappable trust pill on the home screen ("Regulated · Your money is safe") that opens a short FAQ where it shows that the regulation, the savings split, and single-use QR safety. Are all there

5.3.2 Merchant-side refinements

Feedback that made us make a refinement	Refinement made
Both of the merchants said that they merchants got stuck when a customer does not have Frayt or refuses. M1 said the following: "I don’t want to be the one explaining Frayt to every customer after the third time I’ll stop offering it."	So, we worked on adding a skip button that would appear in the POS of the cashier merchants plus one line of script the cashier can repeat

5.3.3 What we did not change, and why

Observation	Why we did not act on it
Consumer 4 he wanted the QR code to be pre-generated where he felt that the process is than CliQ scan-to-pay	Each QR code that id generated in the Frayt app is tied one exchange amount after this process is either successful or a failure the QR cannot be reused or scanned from a screenshot by another phone because it's unique each time the user or merchant generated it to scan it.
M1 and M2 wanted a freemium model over a flat monthly subscription.	This can't be done because at the end this app is software as a service (SAAS), so what they are asking for is actually a pricing and business-model decision, not a prototype change

6.0 Market Size Analysis (TAM, SAM, SOM)

6.1 How we sized the market

We measured the market by one simple thing: how much coin change Jordanians lose every year where we counted it in dinars (JOD). We start with the whole country, then

narrowing it down step by step to the part where Frayt market size would be understandable.

Every number below is shown together with the exact calculation behind it, so each figure can be checked. The numbers come either from public sources (World Bank, JoPACC). Moreover, we used our own survey of 60 people.

6.1.1 TAM, Total Addressable Market

The TAM is the total amount of coin change in all of Jordan that could be turned into digital money. We build it up from the country's population in four simple steps.

- Starting with step 1: **Adults in Jordan**, adults in Jordan that are under the age of 15 are estimated to be 34.3% of the population and based on the Department of statistics of jordan (DOS) there's estimated of 11.55 people so let's multiply 11.55 million people x 65.7% (which are the population that is above the age of 15), so it will be as follows :

Adults in Jordan :11.55 million people x 65.7% = 7.59 million adults

- Step 2: **People who use cash:** 7.59 million adults x 70% = 5.3 million people

About 70% of adults pay with cash regularly, so they are the ones that will actually receive coin change

- Step 3: **Change lost each month :**

5.3 million people x 2.29 JOD = 12.14 million JOD per month

This numbers were taken from the survey where each person said they lose or fail to use about 2.29 JOD of change every month.

- Step 4**: Change lost in a year:** 12.14 million JOD x 12 months = 145.6 million JOD per year

After these calculations the TAM would be estimated to be 145.6 million JOD per year of coin change that goes unused across Jordan.

6.1.2 SAM, Serviceable Addressable Market

SAM is considered the part of the market that Frayt can actually reach with the product we are building, which is a phone wallet that receives change. The people we can serve first are those who already own a mobile wallet and that's because there's no need to have a new account to start receiving change. So instead of all 5.3 million cash users, we will be counting only nowadays wallet owners.

- Step 1: **People who already own a mobile wallet :**

which are considered to be **2.59 million users**

- **Step 2: : Change lost each month :**

2.59 million users x 2.29 JOD = 5.93 million JOD per month

- **Step 3: Change lost in a year:**

5.93 million JOD x 12 months = 71.2 million JOD per year

So, the SAM = about 71.2 million JOD per year of coin change held by people Frayt can reach today.

6.1.3 SOM, Serviceable Obtainable Market

The SOM is the share of the SAM that Frayt can obtain, not every wallet owner but just the portion we can actually win Frayt competes for attention and reputation on how people money would be saved and received.Morever, the signs up merchants one by one, and not everyone who likes the idea becomes a regular user. So, we take 20% of the SAM, which is the standard share used for a new product like this.

- **Step 1: Take 20% of the SAM**
- **Step 2: calculate it in Jordanian dinars :**

71.2 million JOD x 20% = 14.2 million JOD per year

- **Step 3: calculate it in users:**

2.59 million wallet users x 20% = about 520,000 active users

After that the estimation of SOM would be about 14.2 million JOD per year of coin change, or roughly 520,000 active users.

6.2 Summary table for market size

Metric	What was covered	Annual
TAM	All cash using adults in Jordan	Around 145.6M JOD
SAM	Jordanians who already hold a mobile wallet	71.2M JOD
SOM	20% of SAM	14.2M JOD

6.3 Market Size, Reach and Growth Potential

- Size

Jordanians let go of about 145.6 million JOD of coin change every year (the TAM). The part Frayt can reach today are the people who already have a digital wallet, which is worth about 71 million JOD a year (the SAM), of that we aim that Frayt aims to obtain about 14.2 million JOD a year (the SOM).

- Reach

Frayt doesn’t have to build a new infrastructure neither force new habits, 3.48 million Jordanians already use instant digital payments and 2.59 million already hold a mobile wallet so Frayt will be receiving changes that people already use. Moreover, on our own survey 88% of the responds stated that they already uses a digital wallet, and let's not forget that QR-based purchases are still barely used in Jordan (only a few hundred thousand QR transactions in all of 2024), which makes the coin change niche is wide open.

- Growth potential

Digital transactions in Jordan grew 77.2% in 2024 (to 224.62 million), while the average transaction value fell 34.9% to 355.9 JOD which clearly means that Jordanians are increasingly paying digitally for small amounts, which is exactly Frayt intention. And not to mention the instant-payment user base itself grew 21.6% in a single year (from 2.86M to 3.48M). Looking forward projects Jordan’s digital-payments market to grow about 24% per year, where it is estimated to reach around a 10.92 US dollars by the year of 2029. Moreover, "the National Electronic Payments Strategy and the Central Bank of Jordan’s regulatory sandbox actively push cashless adoption" which is what the CBJ stated which will surely result in the growth of Frayt and digital payments more than we ever.

7.0 Competitor Analysis and Positioning

Competitor analysis is very important for Frayt because the fintech market in Jordan already has a strong digital payment solutions like Zain Cash, Orange Money, CliQ, and Reflect. So, these competitors already have a strong user trust, infrastructure, and large costumers bases. But on the other hand, most of them focuses on general payments, money transfer, and wallet services. Frayt is different because it is focusing on a repeated behavior and pain that users go through every day especially users who uses cash

frequently and they face a problem with the small coin change so Frayt solves this problem by converting the physical change into a digital value and the point of purchase.

7.1 Direct and Indirect Competitors

A) Direct competitors

Frayt direct competitors are the platforms who already provides a digital wallets, mobile payment services or instant payment solutions in Jordan. Competitors like Zain cash, Orange money, Reflect, and CliQ. They are considered to be a direct competitors because they already operate in the digital payment ecosystem, and has a existing users, and they could introduce a similar coin change feature in future.

Zain cash and Orange money are strong direct competitors because they already have wide users bases, merchant relationships, and market trust. Moreover, they allow the users to send, receive, withdraw, and pay money digitally, but their main focus is on general digital wallets services, not solving the daily problem of small coin change at cash checkout.

CliQ is also a direct competitor because it is widely used for instant transfer between users, wallets, and bank accounts. However, CliQ mainly focuses on fast money transfer and does not provide a specific solution for converting small cash change into digital value during purchase.

Reflect can also be a direct competitor, especially among the young digital users, because it provides modern digital banking and wallet service. But on the other hand, like the other competitors, it doesn’t solve the coin change issue for merchants and customers.

B)Indirect competitors

Frayt indirect competitors are the alternatives that do not solve the exact coin change problem but can reduce the need for Frayt or replace part of its value, these includes eFAWATERcom, Apple pay, Google wallet, and traditional cash/coins.

eFAWATERcom is an indirect competitor because it is mainly used for bill payments, not for receiving coin change from merchants. However, it competes indirectly with Frayt because Frays plans to allow the users to use their small digital change balance to pay bills with it, this means eFAWATERcom already covers part of the value that Frayt wants to offer later.

Apple pay and Google wallet are also indirect competitors because they allow users to pay digitally without using cash, so if customers pay fully using Apple pay or Google wallet they will not face the coin change problem at all. However, these services do not

solve the issue when customers pay with cash and need to receive small coin change. Therefore, they compete indirectly by reducing cash usage, not by solving coin change itself.

Overall, these indirect competitors show that frayt is not only competing with fintech applications, but also with the existing habits of users and payment behavior. So, frayt advantage here is that it focuses on the missing gap between the cash and digital payments by turning small physical coin change into usable digital value.

7.2 Develop a benchmarking table (price, quality, features, target market)

Criteria	Frayt	Zain cash	Orange money	CliQ	Apple pay/ Google wallet
Competitor type	Main product	Direct competitor	Direct competitor	Direct competitor	Indirect competitor
price	Free for consumers; merchant fees/subscription planned	Transaction/services fees	Transaction/ services fees	Bank/ provider dependent	Free for users linked to bank/card
Service quality	Expected high	High and mature	High and mature	High and mature	High and mature
Main feature	Digital coin change wallet	Digital wallet	Mobile wallet	Instant payment	Contactless digital payments
Coin change management	Core service	Not available	Not available	Not available	Not available
Bill payments	Available / planned	available	available	available	Not main feature

Saving feature	Saving jar	Limited not main focus	Limited not main focus	Limited not main focus	Not main feature
Transfer money	available	available	available	available	Not main focus in Jordan
Withdrawal option	available	available	available	Via bank	Not available
User experience	Simple specialized for coin change	Mature general wallet UX	Mature general wallet UX	Bank oriented UX	Very simple contactless payment UX
Merchant integration	QR + POS integration planned	Existing merchant network	Existing merchant network	Bank integration	Requires NFC / card payment
Main benefit	Turns coin change into usable digital value	General digital transactions	General digital payments	Fast transfer	Allows users to pay without cash
Target market	Cash users and merchant with coin change problem	General digital wallet users	General digital wallet users	Bank users	Card users
Trust level	Medium because it is startup it can be enhanced with the CBJ approval	Very high	Very high	high	Very high
Market coverage	Early stage	Nationwide	Nationwide	Nationwide	Depends on merchant card/ NFC acceptance

7.3 Identify your unique selling points (USPs)

Frayt first unique selling point is that it solves a very specific daily problem which is the small coin change, where most digital focuses on large or general payments, but Frayt focuses on the small amounts that people usually lose, ignore, or leave behind after cash purchases, and this makes Frayt more focused and easier to explain to users.

Moreover, the second USP of Frayt is that it benefits both consumers and merchants at the same time, so consumers get their exact amount of change digitally without the need

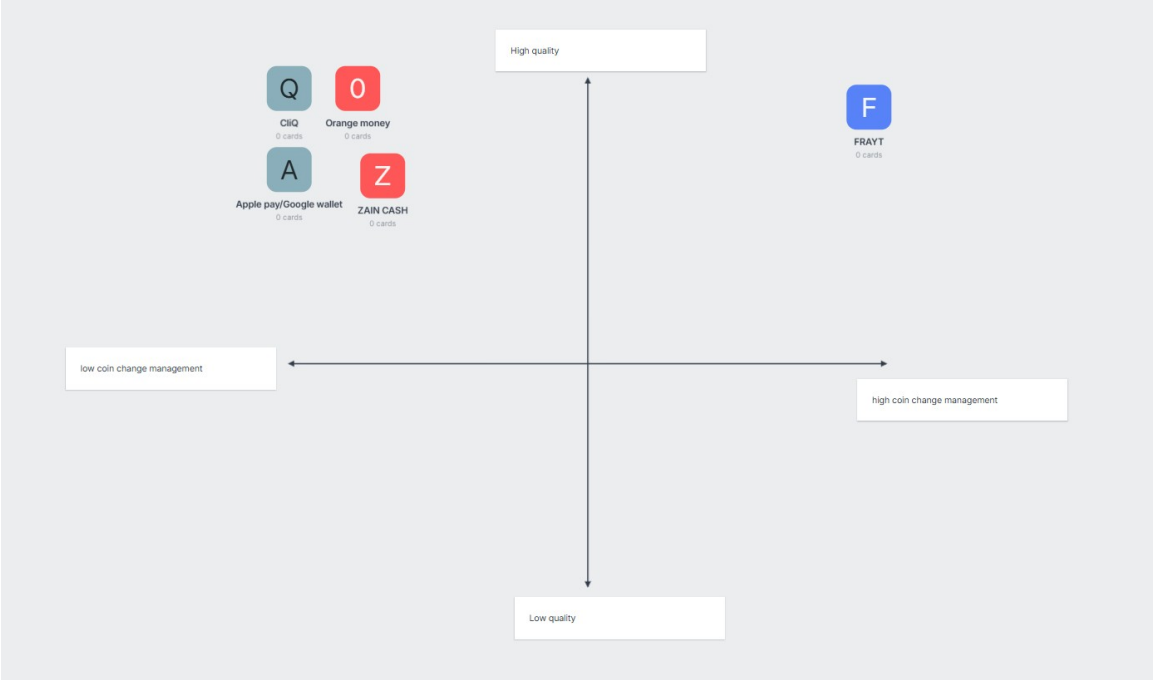

of carrying coins, while the merchants will reduce the coin shortages and make checkout faster. So, this is two sided value and it is important because the problem happens inside the transaction between the both customer and the cashier.

The third USP is flexibility, the users don’t just get the change and leave it locked inside the app, where the balance can be saved, spent at Frayt merchants, transferred, withdrawn, or even donated to a verified charity. So this solves one of the biggest problems in digital wallets, which is the feeling that money is stuck and it is not useful.

In addition, Frayt is free for consumers, this is important because many users might not use the application and refuse the idea if they feel that they are being charged to receive their own small coin change, so the revenue models depends mainly on merchants, float income, and partnership, and this makes it easy to be adopted for customers.

The fifth USP is that it fits strongly with the Jordanian behavior and culture, were many people still using cash in daily purchases, and small coins are commonly ignored or inconvenient. Moreover, many young people are already using digital payment tools, and this makes Frayt suitable for the Jordanian market because it connects existing cash habits with growing digital payment behavior.

7.4 Create a positioning chart (e.g., price vs. quality)

7.5 Product Marketing Positioning

Frayt operates as a Fintech solution that converts physical coin change into usable digital value at the point of transaction. Unlike traditional digital wallets that focus on digital payment and banking services, Frayt focuses on a specific problem. Frayt is positioned as the first dedicated wallet in Jordan that digitizes physical coin change into a flexible value for consumers and merchants.

Frayt uses a hybrid positioning strategy. On one hand, it applies blue ocean positioning strategy for the core feature as it creates a new market space by digitizing small coin change at the point of sale, solving a problem that existing wallets do not solve which makes Frayt not a direct competitor in the wallet market for its core idea. No existing wallets including ZainCash or Orange Money has been designed to solve this specific problem which positions Frayt as a creator of a new category.

On the other hand, it applies red ocean positioning strategy, as it operates in a highly competitive fintech market including ZainCash, and OrangeMoney, as these platforms provide general features for customers such as transfers, payments, and wallet services. These features do not differentiate Frayt as they make it functional enough that users do not need to maintain a separatee general wallet to use Frayt balance.

Frayt is positioned for cash paying consumers in Jordan who regularly receive small coin change during daily purchases, as well as merchants who face coin shortages and slow checkout process which means Frayt is not for all users in the financial system , but only focuses on two specific segments that experience a clear and repetitive problem.

Frayt is not positioned as a general financial platform, but a problem-specific fintech solution which means that it does not aim to replace existing wallets but to improve them by solving a specific inefficiency in cash transactions as it targets a gap that is ignored by current competitors.

8.0 Marketing Strategy (4Ps)

Since Frayt is a fintech solution that solves the daily problem of small coin change, the strategy should focus on making the product easy to understand and promoted through channels that young users and cash-based merchants already use.

Product:

Frayt is a digital coin-change wallet that converts small physical coin change into digital balance. The main product is not a general digital wallet like Zain Cash or Orange Money. Frayt focuses on one clear problem which is customers often lose, ignore, or

leave small coin change after cash purchases, while merchants struggle with coin shortages and return exact change.

The key features of Frayt include receiving exact coin change digitally through QR code, saving the balance is a savings jar, spending the balance Frayt merchants, paying bills, transferring money, withdrawing money, donating to verified charities, and earning reward points. The reports also explain that the value of Fryt is flexibility because users do not revive change that is locked inside the app. They can save it, spend it, transferee it, withdraw it, or donate it.

For customers, the main value is convenience. They no longer need to carry annoying coins, lose small amounts, or leave change behind. For merchants, the value is faster checkout and fewer coin shortages because they can return exact change digitally instead of depending on physical coins. This matches the product slide because the product should be based on what customer needs, and if customer needs to change, the product should be improved to satisfy these needs.

Frayt also creates value for more than one side. Customers get their full change, merchants reduce operational problems, and the Central Bank of Jordan can benefit from reducing reliance on physical coins. The report already states that Frayt's main benefit is turning coin change into usable digital value and that the target marker is cash users and merchants with coin-change problems.

Price:

Frayt will use a free-for-consumers pricing strategy. Customers should not pau any fee to receive or user their own coin change because this cloud stops them from using the app. Frayt is free for consumers and that charging users for receiving their small change would be a concern.

This pricing strategy is justified because Frayt needs fast adaption from consumers first. If many users join, merchants will have more reason to adopt the system. This also matches the price slide, which says the price should be low enough to attract customers but high enough to make a profit. In Frayt's case, the consumer price is zero to remove barriers, while the business earns from merchants and partners.

From merchants, Frayt can use a freemium pricing model. At the beginning, merchants can try Frayt for free to test if customers use it. After that, merchants can pay a small monthly subscription, around 1-7 JOD per month, especially if they want extra features such as POS integration, sales reports, and branding.

Frayt can also take a small merchant transaction fee, such as around 1% from each digital change transfer. This fee is small because the transaction values are small, but it can become useful when the number of merchants and transactions increases. This pricing is suitable because it keeps Frayt attractive for customers while still creating a revenue model from merchants, float income, and promotional partnerships.

Place:

Frayt mainly uses a direct digital channel through its mobile application and web app. Customers will download or open the app, create an account, and use it to scan QR codes and receive their change. The report states that the main channels are IOS and Android apps, with a testing mobile web app already available, and that QR codes connect the customer's wallet with the merchant terminal at the point of sale.

Frayt will also use merchant locations as an important distribution channel. This includes supermarkets, small retail stores, pharmacies, cafes, gas stations, and other cash-based businesses where customers usually receive small coin change. The merchant side of the product allows the cashier to enter the total amount and the paid amount, then generate a QR code for the customer to scan.

Based on the channel side, Frayt uses both direct and indirect channels. The direct channel is from Frayt to the customer through the app. The indirect channel happens through merchants, POS systems, QR codes, JoPACC open finance APIs, and eFAWATEERcom integration. These partners help Frayt become more useful because customers can use their balance in real finical activities such as bill payments and transfers.

The first launch should focus on places where the target users already go, such as unviresty areas, cafes, supermarkets, pharmacies, and small shops. This is important because Frayt needs merchant coverage. If customers cannot use Frayt in enough places, they will not see it as useful.

Promotion:

Promotion means informing customers about Frayt and attracting them to use it. Since Frayt is a new idea, the main goal of promotion should be education and trust. Many customers may not understand why they need a digital coin-change wallet, so the promotion should explain the problem in a simple way.

The first promotional channel should ne social media, especially Instagram, TikTok, and Facebook. These platforms are suitable because Frayt's main customer segment includes young adults who are already comfortable with mobile applications and digital tools.

Frayt should also promote through university WhatsApp groups and student communities because the early target market is young people aged 18-35.

For merchants, promotion should include free trials, simple demonstrations, and in-store materials such as posters, stickers, cashier cards, and QR signs.

Frayt can also use reward-based promotion, where users earn pints after collecting change. These points can be used for discounts, free coffee, vouchers, or donations. This encourages repeat use and makes the app feel more valuable. Charity cosigns can also be effective in Joran because the donation feature connects with the culture of giving.

Frayt's marketing strategy focuses on making the product simple, useful, and trusted. The product solves a real daily problem, the price removes barriers for customers, the place strategy depends on strong merchant availability, and the promotion strategy explains the value of Frayt while building trust and encouraging repeated use.

9.0 Revenue Model

9.1 How Frayt makes money

As we mentioned before, Frayt is free for the people who use it. We do not charge customers any fee, because the whole idea is to make saving spare change easy and worth their time. Instead, Frayt earns from the merchant side of the service and from the money that moves through and sits inside the app.

There are two main methods. The first is a small fee that merchants pay on each amount of change they send to a customer. The second is float income, which is the return earned on the balances that users keep in their wallets while the money is being held safely. On top of these two partnership deals with shops and brands that want to run promotions inside the app.

We don't charge users so when they apply to join Frayt it can be an easy experience without any obstacles which will result in both the merchants and the users growing. As more merchants adopt Frayt and the more people uses it the more change moves through the app and the more value is held in it, so every one of these streams grows together rather than depending on focusing on a single source.

9.2 Key revenue streams

Frayt works within four streams The first two are the main sources of income, and the last two grow in importance as the Frayt community gets bigger.

1. Merchant subscription:

Merchants that wants Frayt to be applied into their point of sale so they can get rid of the change problem and receive extras such as sales reports will have to pay 1 to 7 JOD a month

2. Float income:

The balances that users leave in their wallets are held safely and earn a return for Frayt of about 3% per year

3. Partnerships and promotions:

Shops and brands pay to offer rewards or run promotions inside the app. The pricing is set per deal, and it may also be a share of the spending that happens through Frayt inside the shop.

4. Merchant transaction fee:

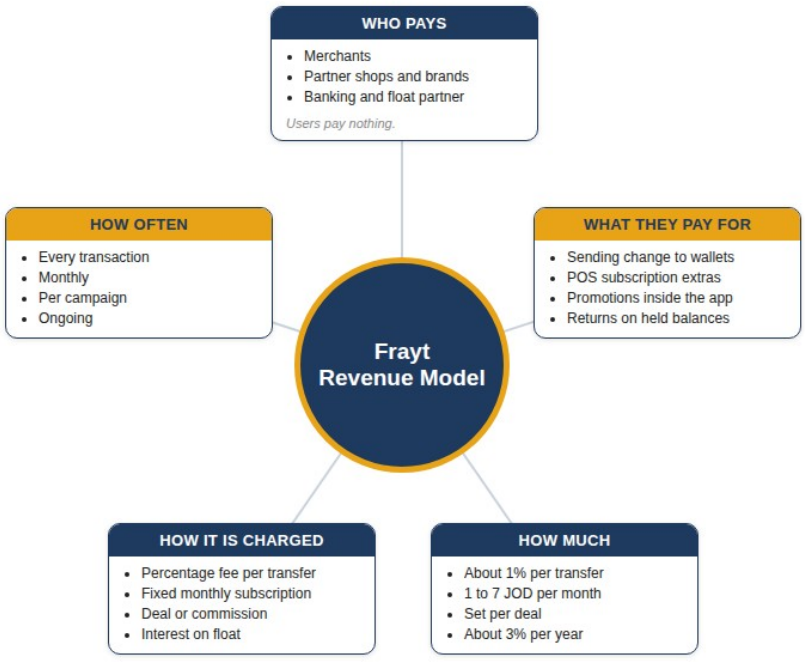

Each time a merchant sends change into a customer's wallet, Frayt keeps a small percentage of about 1%.

Let's sum up everything in a table along with adding a diagram that shows how the stream works :

Stream	Who pays	How it is charged	How much	How often
Merchant subscription	Merchants	Fixed monthly	1 to 7 JOD /	Monthly

		plan	month	
Float income	Earned through banking partner	Return on held balances	about 3% / year	Ongoing
Partnerships and promotions	Shops and brands	Deal or commission	set per deal	Per campaign
Merchant transaction fee	Merchants	Percentage of each transfer	about 1%	Every transaction

The diagram below sums up the model on one page: who pays Frayt, what they pay for, how the payment is charged, how much it is, and how often it happens.

10.0 Projected Profit

Frayt is projected to run at a small loss in its first year while merchants are onboarded, and then to become profitable. These figures are projections based on the team's assumptions, not actual results (all values in JOD).

Year 1: net loss of 19,614 JOD.

Year 2: net profit of 39,571 JOD.

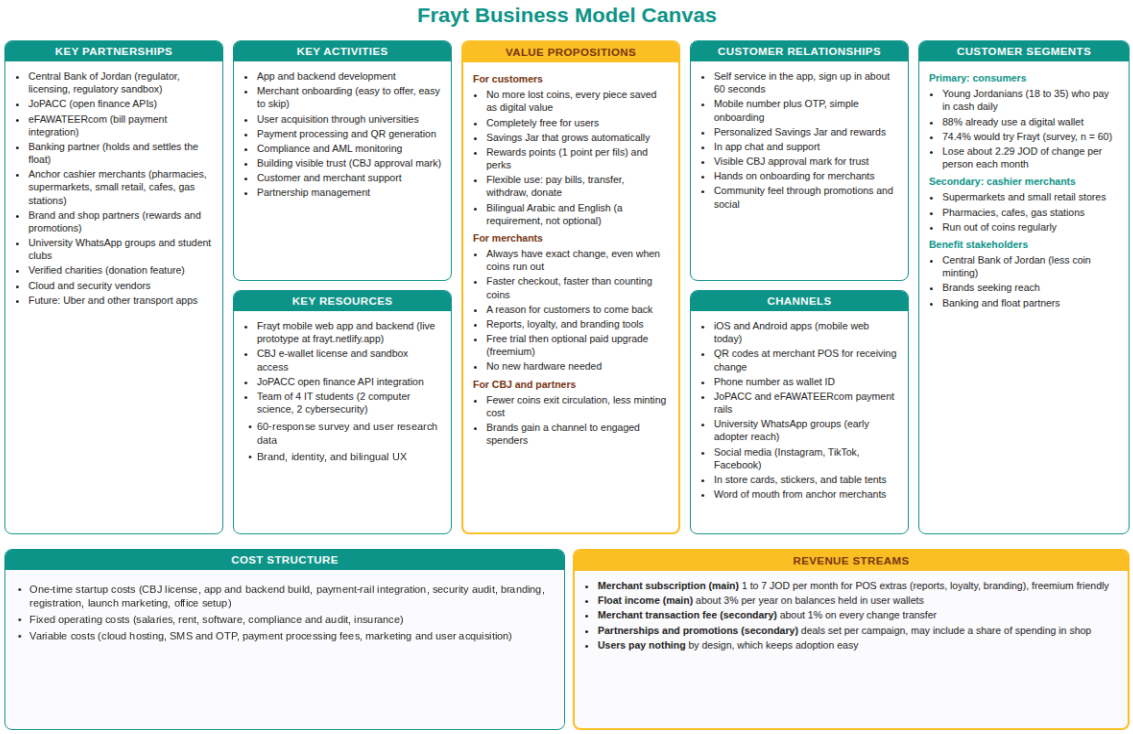

Year 3: net profit of 123,746 JOD.

Over the three years, the cumulative net profit is 143,703 JOD.

11.0 Business Model Canvas (BMC)

11.1 complete Business Model Canvas for Frayt

The figure below shows the Frayt business model canvas.

11.2 Explaining each component clearly

1- Customer segments

Frayt serves two main segments and a few benefit stakeholders. The primary segment are cash paying consumers, especially young Jordanians aged 18 to 35 who make purchases in supermarkets and different retail stores. Back in research the survey showed that out of 60 people backs this up 88% of respondents already use a digital wallet, 74.4% said they

would try Frayt, and the average person reported losing about 2.29 JOD of coin change every month. The prototype is built around this group, with the home screen showing the balance, the Savings Jar, the rewards points and the recent activity in one place.

As for the second segment, which is the cashier merchants in supermarkets, small retail stores, pharmacies, cafes, and gas stations, who deal with coin shortages regularly. The prototype's Merchant POS screen is built for them: the cashier enters the total and what the customer paid, and the change is sent through Frayt instead of in physical coins. Around these two segments there are benefit stakeholders too. The Central Bank of Jordan benefits because fewer coins exit circulation, which lowers the cost of producing replacement coins. Brand partners get a new channel to engaged spenders, and the banking partner earns from holding the float.

2- Value proposition

We made it clearly for customers that we are trying to give a simple solution where there's no more lost coins, every piece of change is saved as digital value, the app is completely free, the Savings Jar grows on its own, and rewards points (one point per change) where it can be redeemed for things like free coffee, vouchers and even make charitable donations. The digital balance is flexible, so users can spend it at any Frayt merchant, pay bills (electricity, water, internet, mobile, university, government), transfer it, withdraw it. And let's not forget that of course the interface is bilingual in Arabic and English, which is not optional where the country is adopting this solution is an Arab country it is a requirement.

For merchants, it is about solving the daily coin shortage problem in a way that does not slow checkout. With Frayt the merchant always has exact change, the checkout is faster than counting coins and customers get a reason to come back through loyalty and rewards. Merchants on the subscription plan also get sales reports, loyalty tools, and branding inside the app, and the testing showed they prefer a free trial with an optional paid upgrade (a freemium model) over a flat monthly fee. They do not need any new hardware because Frayt works on top of the QR codes and POS systems which is considered highly in used nowadays. As for the Central Bank of Jordan the value is fewer coins exiting circulation (lower minting cost).

3. Channels

The main channels are the iOS and Android apps (and we do have a testing mobile web app version that is already live where you can access at frayt.netlify.app). At the point of sale, QR codes link the customer's wallet to the merchant's terminal so the change can move instantly, exactly like the Scan to receive change flow in the prototype. Behind the

scenes, Frayt rides on JoPACC open finance APIs and eFAWATEERcom so money can move safely between bank accounts, wallets and bill payments.

For marketing and awareness, the most important channel in the early phase is university WhatsApp groups, which is how we plan to reach the daily-cash-using 18 to 35 segment, the same way we communicated with testers for the prototype. And of course we'll be using social media (Instagram, Tiktok, Facebook), in-store cards, stickers, and as we stated in the test plan, we'll make merchants talk about Frayt.

4- Customer Relationships

The experience is considered to be mostly self-service inside the app. Sign-up is fast (about sixty seconds with a mobile number and a national ID), the OTP confirms the phone, and from that point users can scan, pay, save, redeem and donate without anyone's help.

Frayt also offers in-app chat and support. However, the merchant flow is intentionally designed to be easy to offer and easy to skip, so the cashier never feels burdened when a customer is in a hurry or does not have Frayt. And let's not forget the most important part which is trust testing showed users explicitly ask whether Frayt is regulated, so a visible CBJ approval mark on the home screen is part of the plan, alongside clear privacy and the fact that the basic service is free for users.

5- Revenue streams

Frayt earns from four streams, and users pay nothing at all. The two main streams are the merchant subscription and the float. The merchant subscription is 1 to 7 JOD per month from each merchant who wants the POS extras like sales reports, loyalty tools and branding. The merchant testing also showed they prefer a free trial with an optional paid upgrade (a freemium model) over a flat fee, so the subscription is best framed as a freemium add-on. The float income is about 3% per year on the balances held in user wallets, and it grows naturally as more users keep their change inside the app.

6- Key resources

As for now, since Frayt is live using the Netlify hosting servers it is considered the most important along with the backend behind it. Alongside the platform, the CBJ e-wallet license and access to the CBJ regulatory sandbox are what let Frayt test and operate

legally. The integration into JoPACC's open finance APIs and eFAWATEERcom is the other key technical resource, because that is what lets money and bill payments move through Jordan's existing financial system.

Not just a technical side our team itself (AL-Ashira) is considered a key resource : four IT students, two from computer science and two from cybersecurity, which gives the project coding, design, system development and security skills. The brand, the bilingual identity, and the trust we build with users and merchants are also resources, Finally, we already have, which is the data with the 60 survey responses.

7- Key activities

In order to Frayt to run there's a lot of work that happened, starting with the . Product development keeps the app, the backend, and the QR flow working. Merchants signs up to new shops and trains the cashiers on the flow, with a focus on making it easy to offer and easy to skip so the cashier never feels burdened during a busy shift. User acquisition reaches the 18 to 35 segment mainly through university WhatsApp groups, social media and the visible presence of merchants.

Moreover, the team handles payment processing and QR generation in the background, keeps up with CBJ compliance and AML monitoring, runs customer and merchant support, builds visible trust signals (like a CBJ approval mark on the home screen).

8- Key partnerships

Our most important partner is CBJ and that's because it issues the e-wallet license, sets the rules we have to follow, and runs the regulatory sandbox we can test in. JoPACC's open finance APIs are the other partner we have, since that is how Frayt plugs into the wider financial ecosystem. eFAWATEERcom is the partnership behind the bill-payment feature in the prototype, so users can pay electricity, water, mobile, internet, and government bills directly from their Frayt balance.

Let's not forget cashier merchants in pharmacies, supermarkets, small retail stores, cafes, and gas stations are the partners that make the first version of the network. Brand and shop partners run promotions and add an extra revenue stream. University WhatsApp groups and student clubs give Frayt direct access to its main consumer segment in the early days. Verified charities are partners on the donation feature, and cloud and security vendors keep the platform stable and safe. Looking ahead, Frayt showed Uber as a clear future partnership, because every Uber ride that ends with not an exact change which is a natural fit for the model.

9- Cost structure

Frayt's costs fall into two groups. The one-time startup costs cover the CBJ license, the app and backend build, payment-rail integration, the security audit, branding, company registration, launch marketing, and office setup. The ongoing operating costs cover salaries, rent, software, compliance and audit fees, and insurance.

And the variable costs like cloud hosting, marketing and user acquisition, SMS and OTP, and payment processing fees rise gradually as Frayt grows.

11.3 how components are interconnected and support the feasibility

The value proposition to consumers where we are providing a free instant, spendable digital change solution to drive consumers adoption. Consumer adoption gives merchants a reason to participate. Merchant participation expands the network, which makes the wallet more useful to every consumer, which drives more consumer adoption. This is the network effect that makes Frayt business model viable and it is also the chicken-and-egg risk that makes the entry strategy so important. Launching on a university campus where Frayt can seed both consumers and merchants simultaneously, which is specifically designed to start this loop before attempting to scale in the open market.

The CBJ regulatory relationship connects to almost every other block in the BMC where the product is legally operational (key resources), reduces consumer trust barriers (customer relationships), enables payment rail integration (key activities), and becomes a visible signal (channels). Obtaining the license is the investment that unlocks everything else for Frayt.

As for the revenue model, the first year is for validation. Year 2 is about proving the network can grow. Our priority is getting to the point where merchant subscriptions and transaction fees cover operating costs.

12.0 Final Prototype Development

The final prototype for Frayt was designed to solve the problem of coin change in everyday cash transactions. The prototype is a mobile-based digital wallet system that allows users to convert small physical coin change into digital balance at the point of purchase.

12.1 Core Functionalities of the Final Prototype

- Consumer Dashboard: display user balance and show a clear buttons to access the features.

    - Coin Digitizing: Simulates the process of converting small coin change into digital wallet by pointing the camera to the QR code generated by the merchant.
    - Transaction History: Records of all user activities such as coins digitized.
    - Pay with Frayt: A feature that allows the user to pay bills with Frayt such as electricity, internet, water, etc.
    - Point System: Point system that allows users to redeem rewards using points such as vouchers or donations.
    - Saving Jar: A feature that allow the user to save their money in a saving jar.
- Merchant Dashboard: display the main process of specifying how much the customer paid and the amount due.
    - QR Code Generation: Simulates the process of generating a QR code to display it for the consumer.

12.2 Evolution

Frayt started as a concept focused only on solving the inconvenience of carrying the coins without any structured system. Then an inital system was developed as a prototype, and it was refined repeatedly after the testing stage. After all these refinements, we concluded to the current version of the prototype, as it transforms the idea into an interactive application that includes a realistic user flow, and a complete simulation of how coin digitization would work in the real world.

The evolution showed a progression from concept to development to testing to refinements.

12.3 How it Addresses the Identified Problem

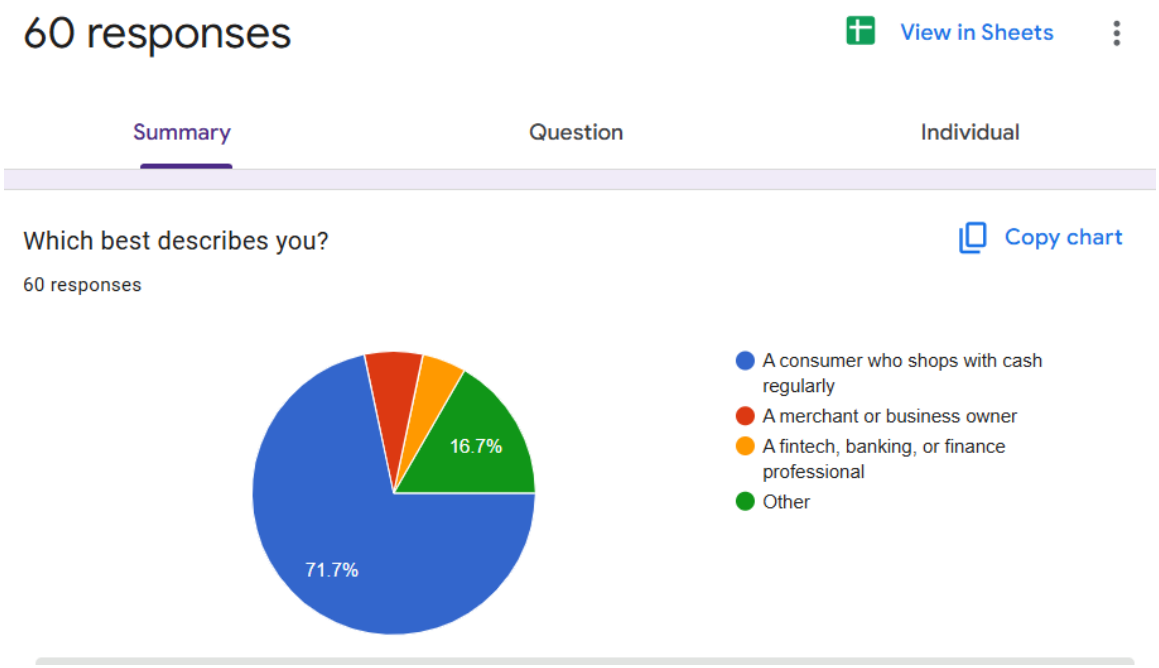

The main problem identified was that small coin change in daily transactions is sometimes inconvenient to carry, unused, or lost in value. Frayt solves this by converting that unused physical value into a usable digital balance. Another problem for the merchant was that they sometimes run out of coins which make the checkout slower and decrease customer satisfaction. Frayt also solves this by allowing merchants to give exact full coin change without any delay which makes the customer leave happy.

For the consumers, Frayt eliminates the need to carry coins, make an easy storage of small unused money, and it gives better control over small amounts of money. For the merchants, Frayt provides a faster checkout experience, reduces the need of handling physical coin change, and gives a more efficient transaction flow.

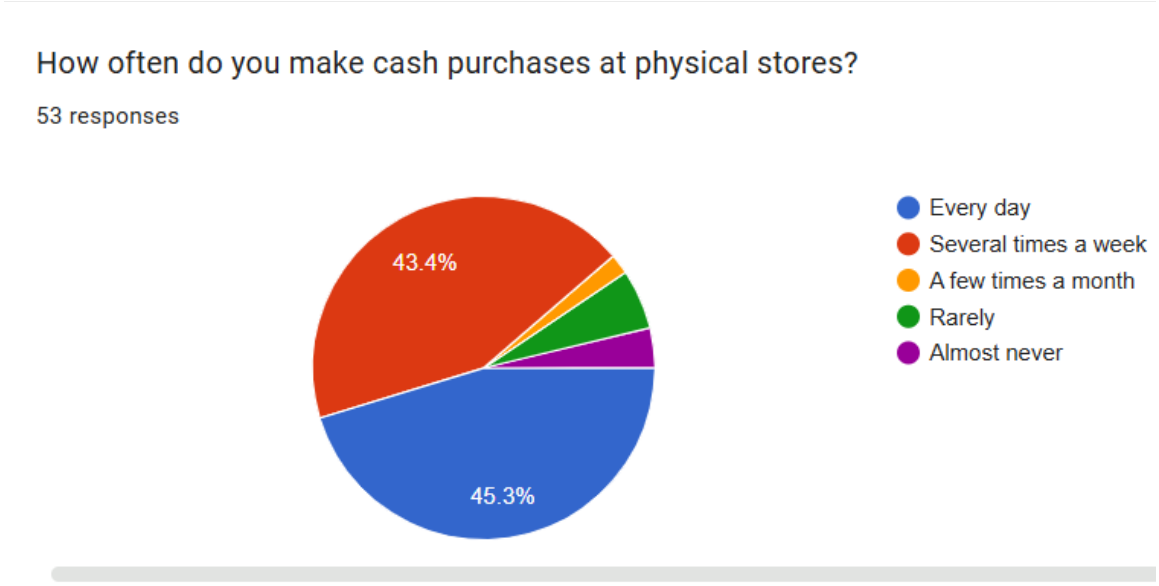

Appendix A

In this appendix survey responses and numbers will be verified for ***section 1.2***.

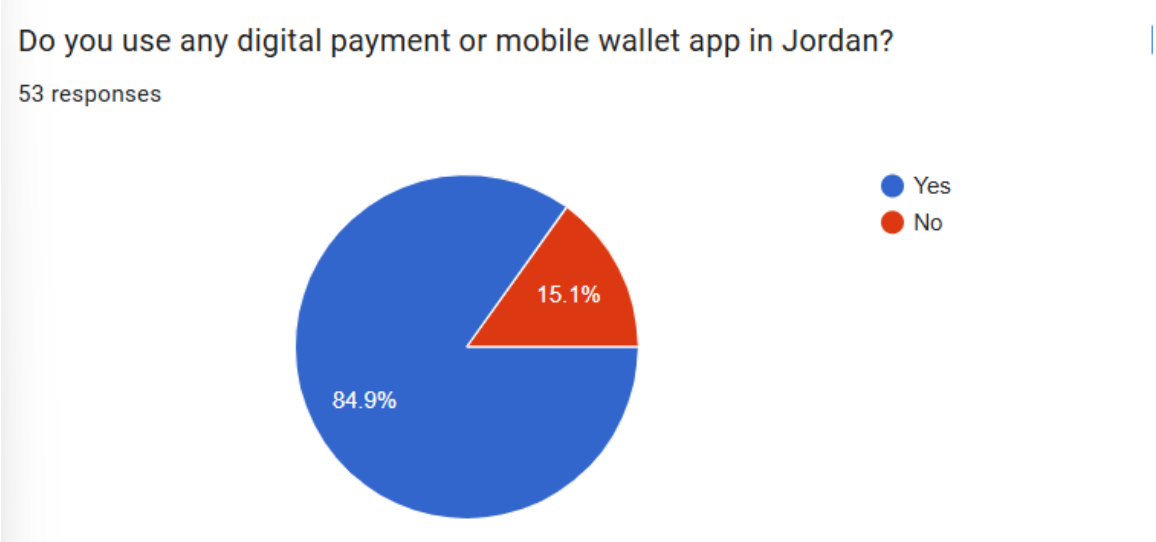

The first picture shows relevant stakeholders number of responses and stakeholders percentage.

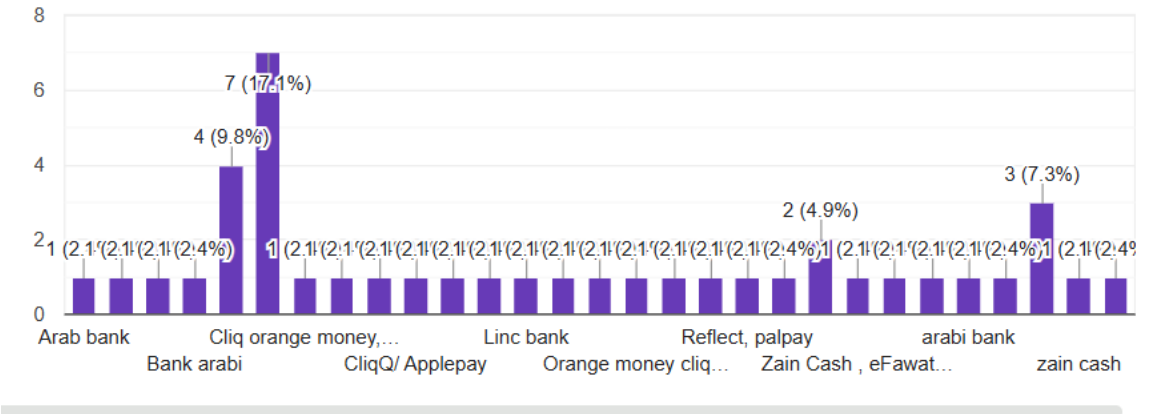

We can verify from the numbers the question of ***" How often do you make cash purchases? "*** in the figure below :

As for "***the use of digital payments*** " can be verified from the figure below :

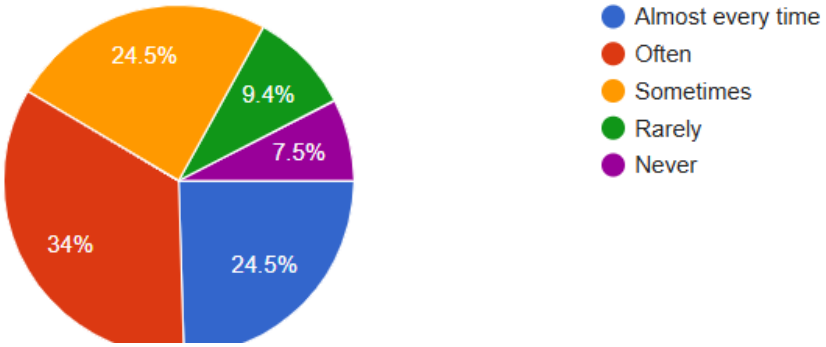

As for the apps :

For the section of ***1.2.3 "Is the coin problem actually real?"*** we can verify from the figures below :

How often do you receive coin change that you later lose, forget, or don't use?

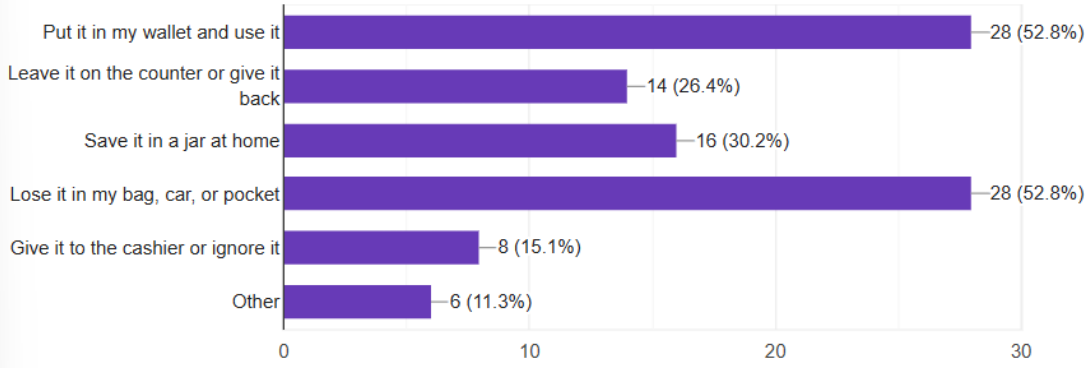

53 responses

What do you usually do with coin change? Select all that apply.

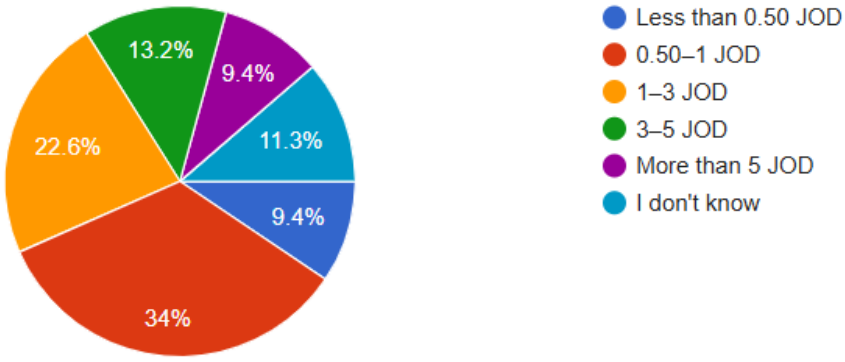

Copy chart

53 responses

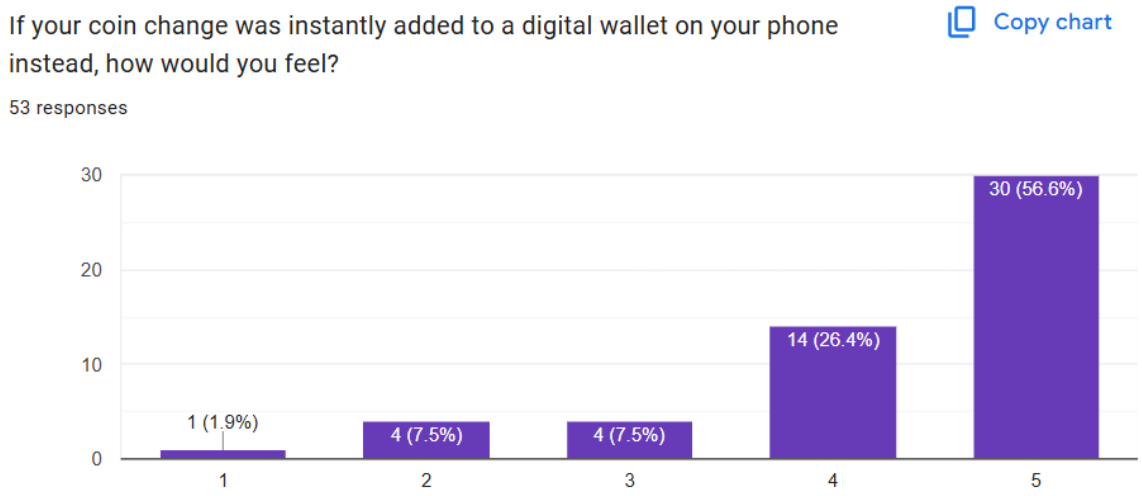

How much in coins do you think you lose or don't use per month?

53 responses

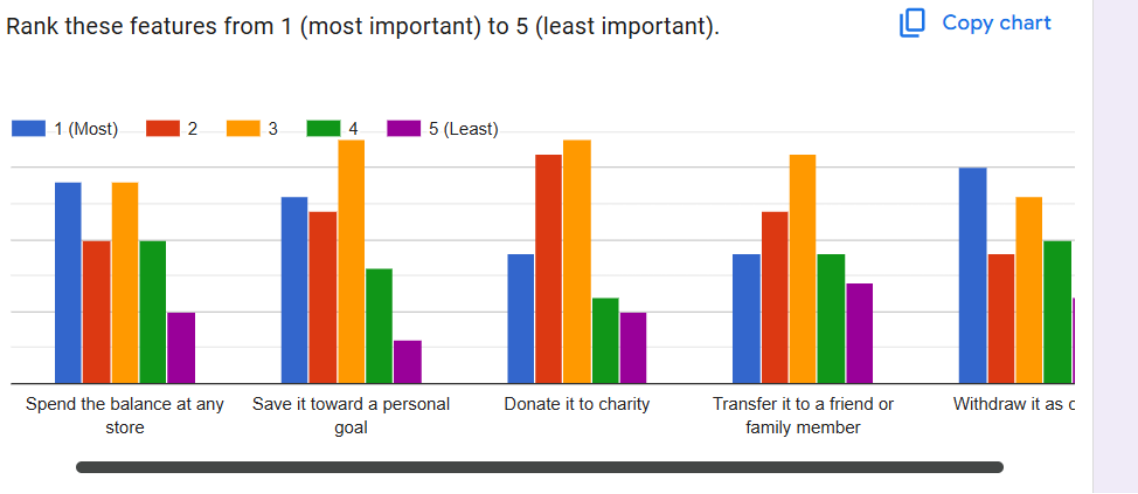

For section ***1.2.4 " How does it feel?",*** where we can verify from the numbers from the figures below :

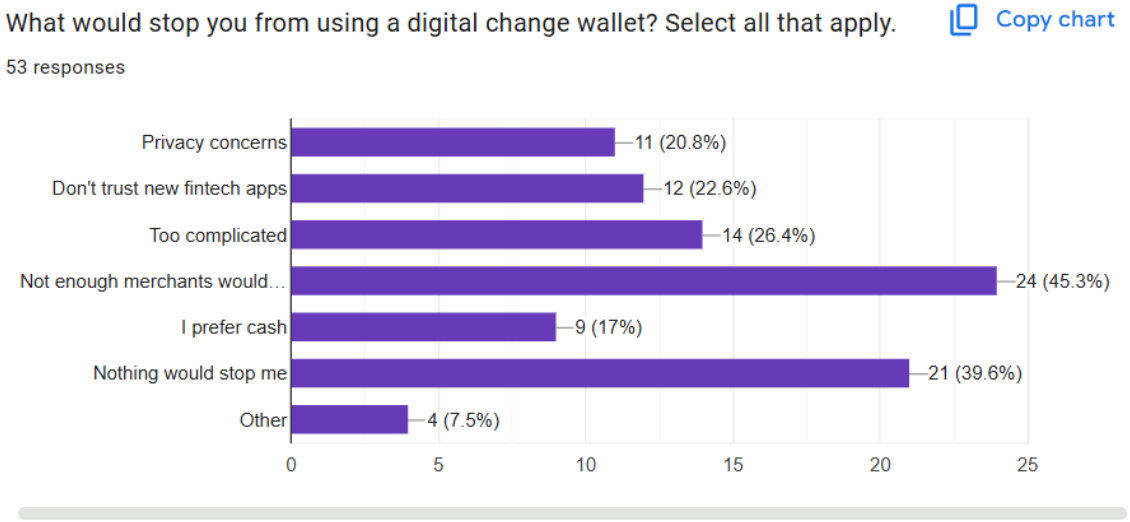

For section ***1.2.5 "How do people feel about the idea of digital change?"*** we can see the numbers in the figure below :

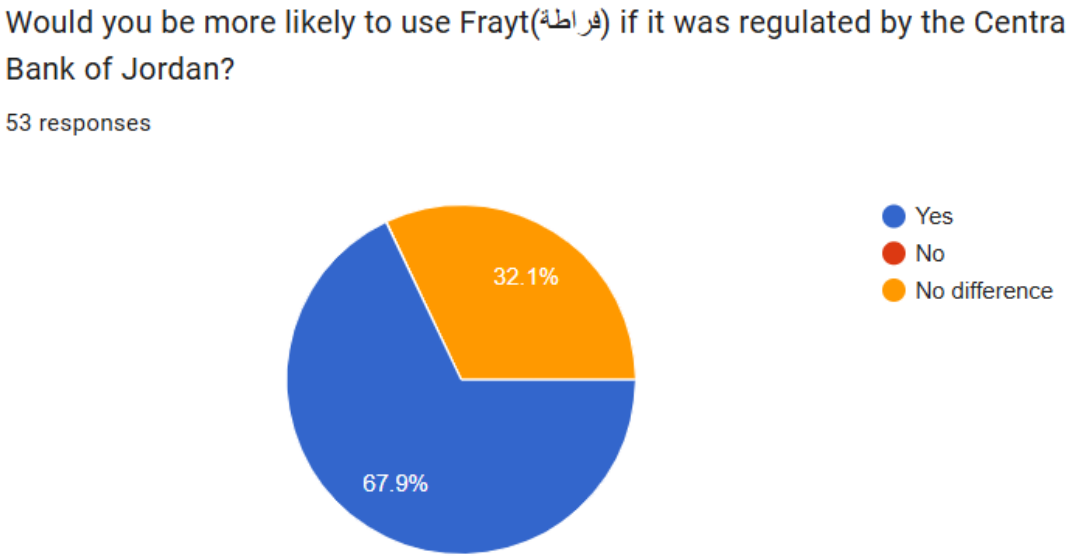

For section ***1.2.6 "What features matter most?"*** we can see the numbers in the figure below :

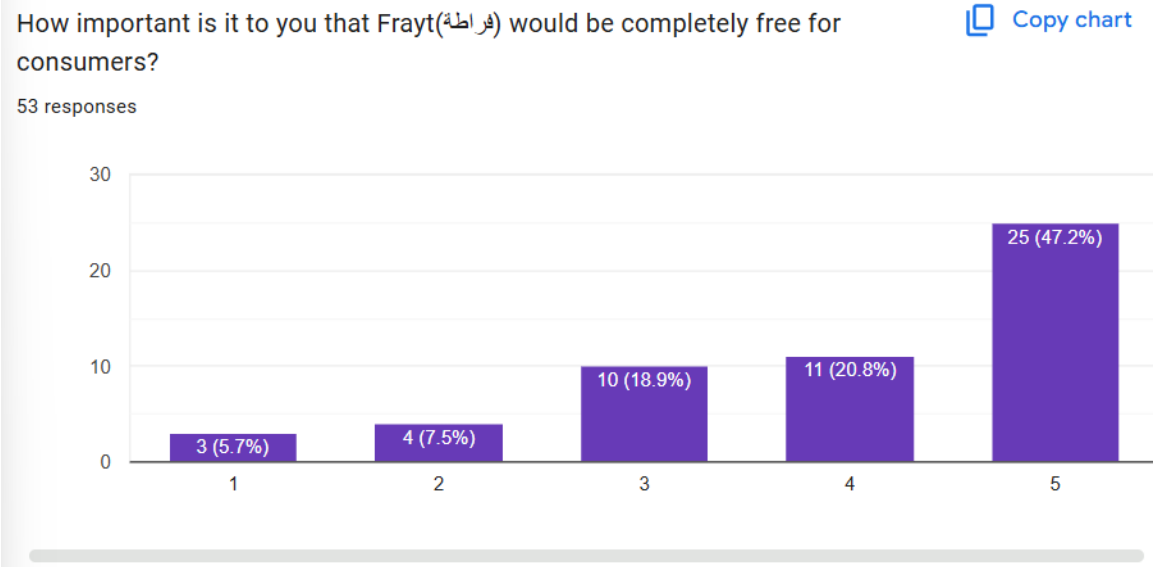

For section ***1.2.7 "What might stop people from using Frayt?"*** we can see the numbers in the figure below :

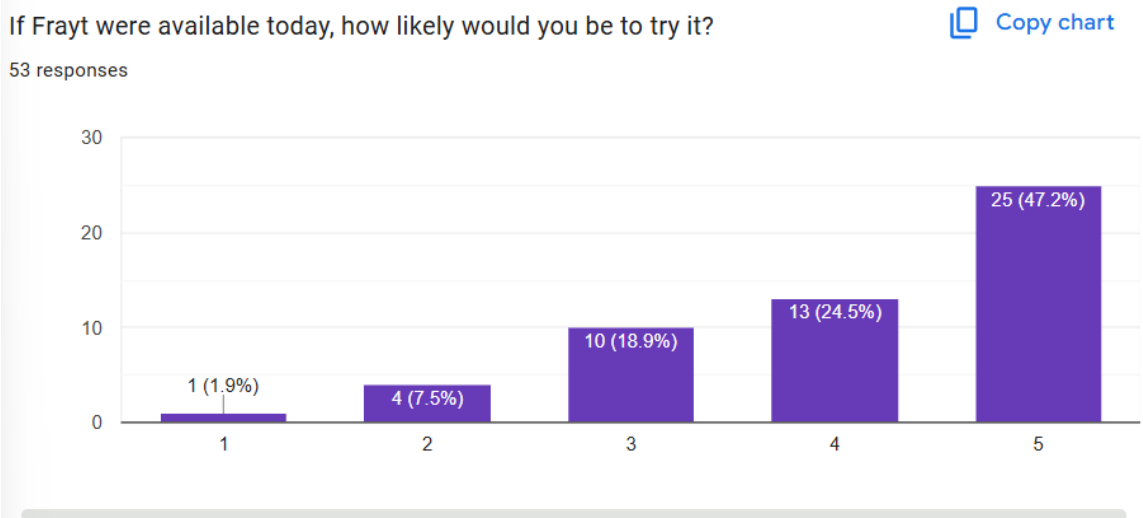

For section ***1.2.8 "Do they trust CBJ regulation?"*** we can see the numbers in the figure below :

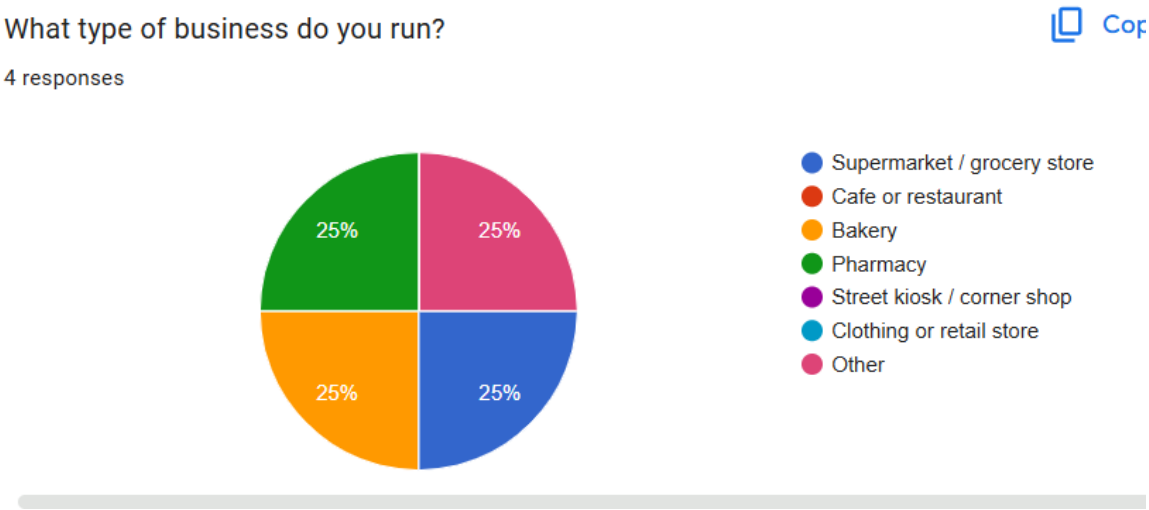

For the section ***1.2.9 "How important is it that Frayt is free for consumers?"*** we can see the numbers in the figure below :

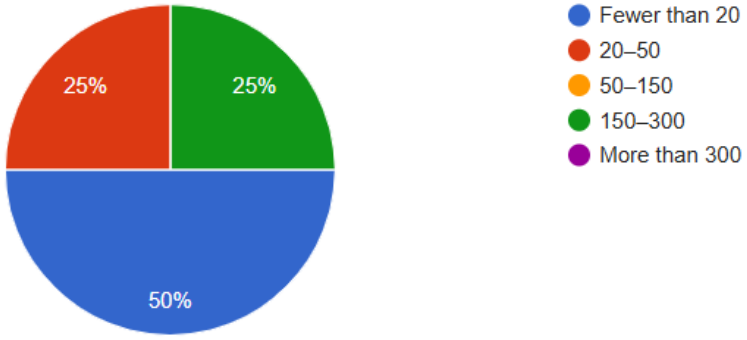

For section ***1.2.10 What Merchants Told Us (n=4)*** we can see the numbers in the figure below :

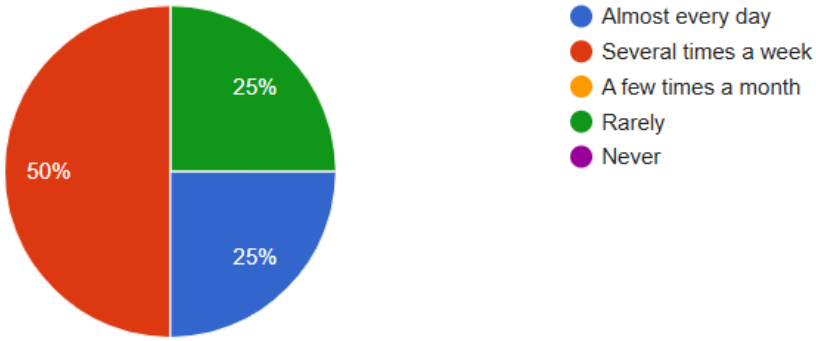

Roughly how many cash transactions does your business handle per day?

4 responses

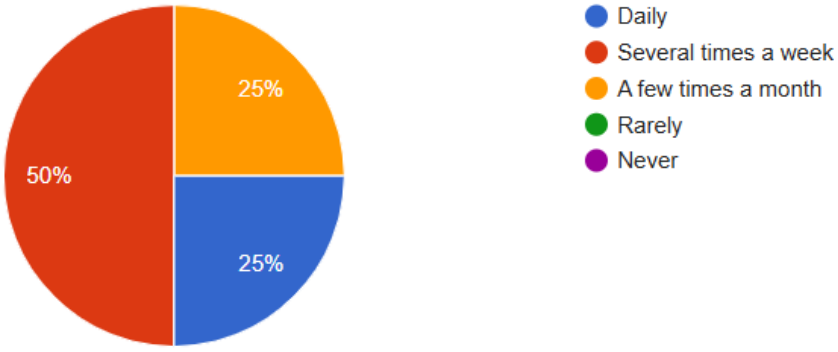

How often does your business run out of coins to give as change?

4 responses

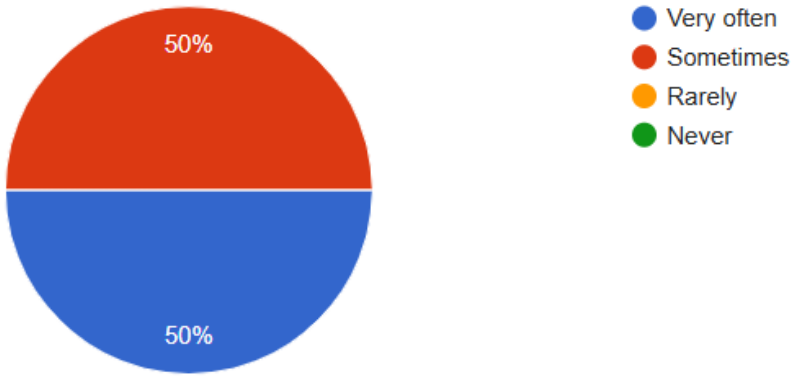

How often do you round up or give extra because you can't provide exact change?

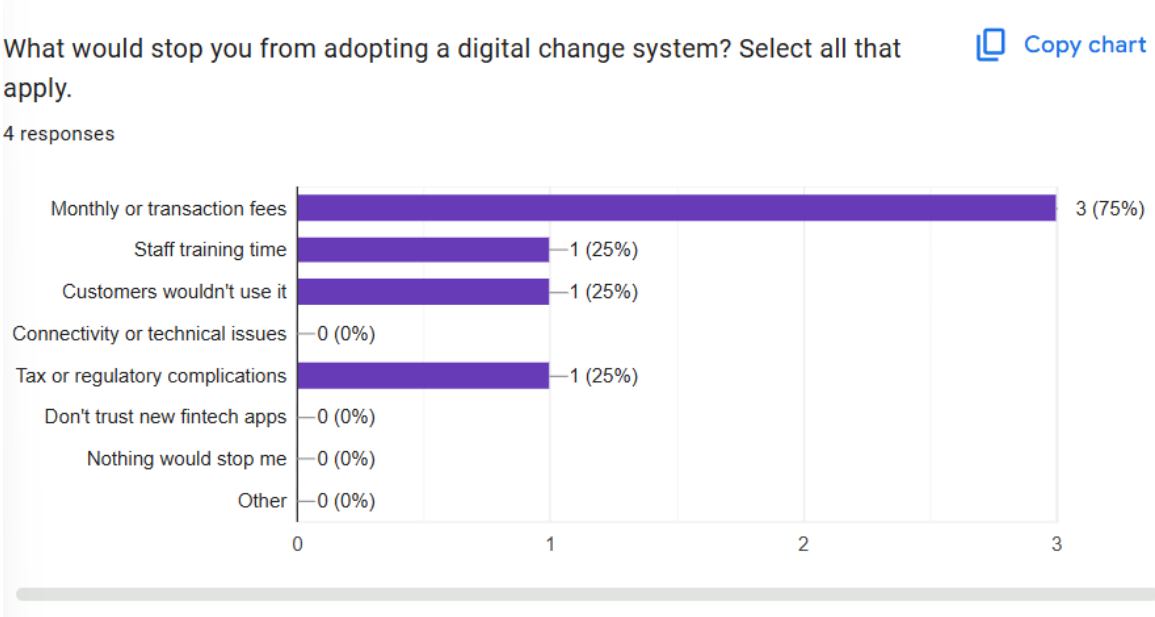

4 responses

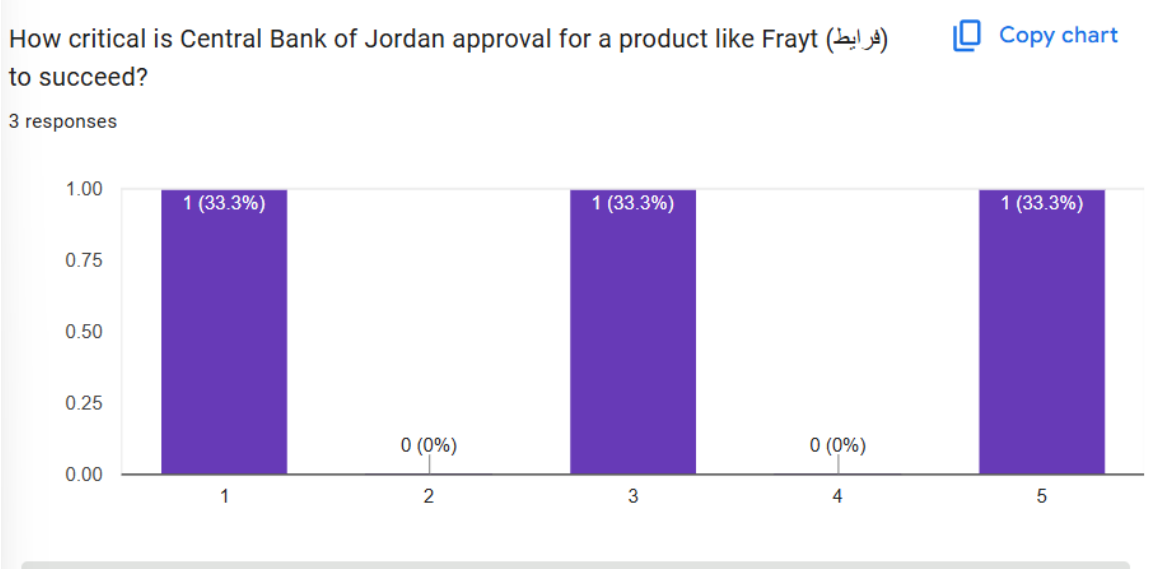

How often do customers seem frustrated or refuse coin change?

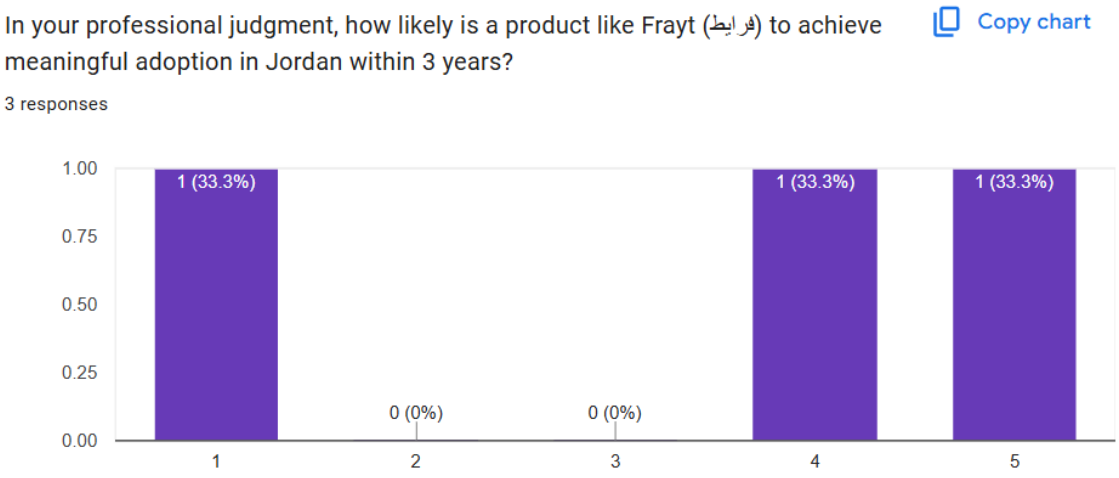

4 responses

For the section ***1.2.11 What Finance/Fintech Experts Told Us (n=3)*** we can see the numbers in the figure below :

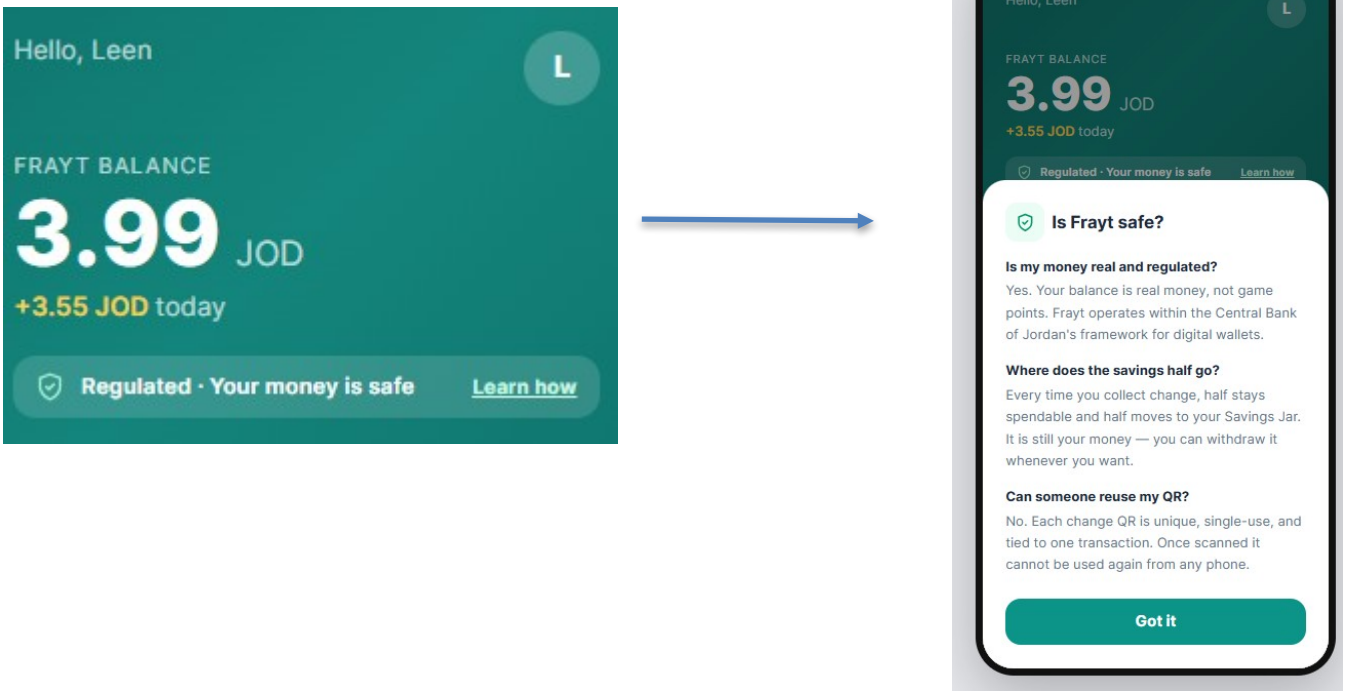

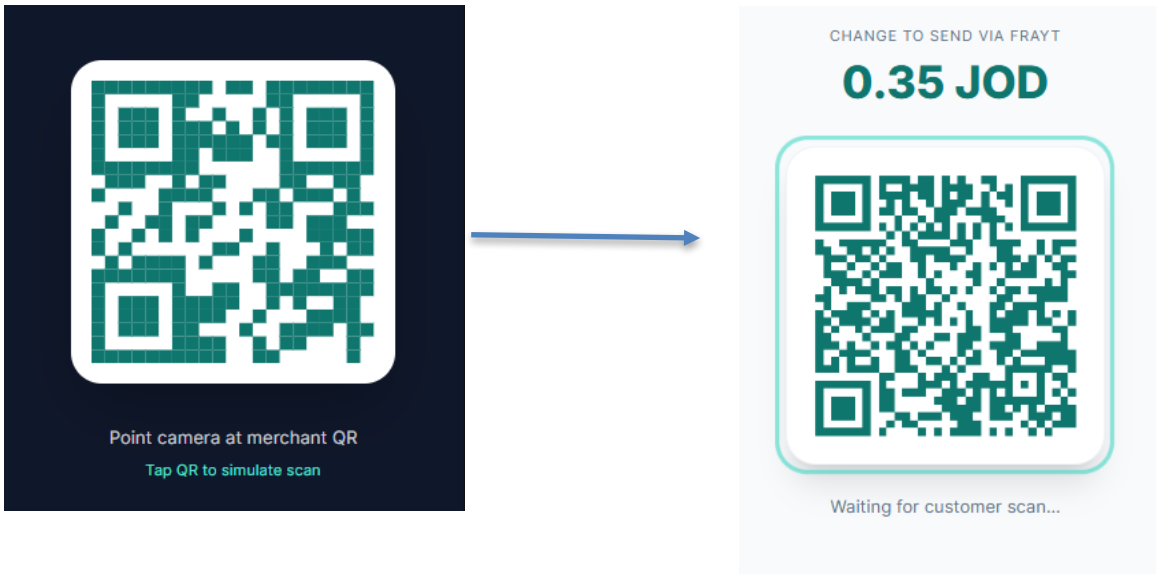

Appendix B

In this appendix you can check the refinements we stated in section 5.3 :

The Regulations :

Now the QR code shows that this should go within the merchants QR within his POS

After everything is succful we can see the summary of what happened and where did the change go :
